The US Department of Energy (DOE) Office of Remedial Action and Waste Technology established the Technical Measurements Center at the DOE Grand Junction, Colorado, Projects Office to standardize, calibrate, and compare measurements made in support of DOE remedial action programs. Indoor radon-daughter concentration measurements are made to determine whether a structure is in need of remedial action. The Technical Measurements Center conducted this study to validate an abbreviated Radon Progeny Integrated Sampling Unit (RPISU) method of making indoor radon-daughter measurements to determine whether a structure has a radon-daughter concentration (RDC) below the levels specified in various program standards. The Technical Measurements Center established a criterion against which RDC measurements made using the RPISU sampling method are evaluated to determine if sampling can be terminated or whether further measurements are required. This abbreviated RPISU criterion was tested against 317 actual sets of RPISU data from measurements made over an eight-year period in Mesa County, Colorado. The data from each location were tested against a standard that was assumed to be the same as the actual annual average RDC from that location. At only two locations was the criterion found to fail. Using the abbreviated RPISU method, only 0.6% of locations sampled

can be expected to be falsely indicated as having annual average RDC levels below a given standard.

**37821 (DP-MS—87-37) Risk assessment of soil contamination criteria.** King, C.M.; Marter, W.L.; Montaque, D.F.; Holton, G.A. (Savannah River Lab., Aiken, SC (USA); JBF Associates, Knoxville, TN (USA)). Jun 1987. Contract AC09-76SR00001. 25p. (CONF-8706136—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011179.

From AICHE division of health and safety meeting; Houston, TX, USA (4 Jun 1987).

Criteria have been developed to select radioactive and nonradioactive contaminants at waste sites detailed analysis and risk assessment. These criteria were based on soil and water quality guidelines developed by various government agencies to determine if the criteria were appropriate. We performed a risk assessment of a hypothetical site which contained radioactive and nonradioactive contaminants at levels equal to the criteria values. Risks to the public from atmospheric, surface water, and groundwater exposure pathways were examined. Health risks to the public from atmospheric releases of radioactive and nonradioactive materials from a waste at soil criteria contamination levels are low. Health risks to the maximally exposed individual to chemical carcinogens are considerably below traditional EPA action levels. And health risks to the maximally exposed individual to atmospherically released radioactive contaminants is $1.88 \times 10^{-7}$, more than a factor of 5 less than $10^{-6}$. Based on our atmospheric exposure pathways analysis and risk assessment, the applied soil criteria are appropriate for screening out unimportant risk contributors to human health from atmospheric exposure pathways. 13 refs., 3 figs., 7 tabs.

**37822 (SAND—85-0008) Sandia implementation of the TRACR3D flow and transport code: Nevada Nuclear Waste Storage Investigations Project.** Prindle, N.K.; Foster, J. (Technadyne Engineering Consultants, Inc., Albuquerque, NM (USA); Sandia National Labs., Albuquerque, NM (USA)). Jun 1987. Contract AC04-76DP00789. 83p. NTIS, PC E04/MF A01; 1; GPO Dep. File Number DE87012507.

TRACR3D is a computer code developed at Los Alamos National Laboratory to model three-dimensional fluid flow and mass transport in a porous medium. The code is being considered for use in performance assessment modeling of a potential repository for high-level radioactive wastes at Yucca Mountain in Nye County, Nevada. This report describes modifications made during the installation and implementation of the code at Sandia National Laboratories and the results of some test problems. The operating system commands necessary to direct TRACR3D on the CRAY-1 computer at Sandia are included, and a flow chart outlining the code structure is presented.

**37823 Carbon and isotopic mass balance models of Oasis Valley-Fortymile Canyon ground water basin, southern Nevada.** White, A.F.; Chuma, N.J. (Lawrence Berkeley Lab., CA). *Water Resources Research;* **23**: No. 4, 571-582(Apr 1987).

Environmental isotopes and carbon chemistry provide means of differentiating various recharge areas, flow paths, and ages of ground water in portions of the Nevada Test Site and vicinity. Regional $\delta D/\delta^{18}O$ trends are offset from the present-day meteoric line by a deuterium depletion of 5 per thousandth, suggesting paleoclimatic changes. Partial pressures of $CO_2$ and the $^{18}O$ and $^{13}C$ data indicate solubility and isotopic equilibrium between the gas and water in the soil zone with progressive exchange with underlying ground water in the shallow alluvium of Oasis Valley. Application of a closed system $CO_2$ model using the EQ3NR/EQ6 reaction path simulator successfully reproduces chemical compositions observed in the alluvium in the Amargosa Desert and in the deep tuff aquifer beneath Pahute Mesa and Yucca Mountain. Initial P/sub $CO_2$/ input to the soil zone during recharge was calculated to range from 0.03 to 0.10 atm, which is comparable to measured soil $CO_2$ pressures in Oasis Valley. Results are compared for $^{14}C$ ages using the $\delta^{13}C$ dilution correction and a mass action correction term relating predicted and calculated ionic activity products of $CaCO_3$. Results are generally comparable with discrepancies attributed to anomalous $\delta^{13}C$ values.

**37824 (CONF-870297—1) Gas pressure and concentration gradients at the top of a landfill.** Bogner, J.; Vogt, M.; Moore, C.; Gartman, D. (Argonne National Lab., IL (USA); Geotechnics, Inc., Columbus, OH (USA)). 1987. Contract W-31109-ENG-38. 22p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011490.

From 10. international landfill gas symposium; West Palm Beach, FL, USA (9 Feb 1987).

Vertical gas pressure and concentration gradients are being investigated at the Mallard North Landfill (DuPage County, Illinois) using nests of probes installed in the top of refuse and at two depths in the clay cover materials. Soil gas pressures and atmospheric pressure are monitored continuously using electronic pressure transducers linked to a microcomputer. Concentrations of methane, carbon dioxide, nitrogen, and oxygen in the soil gas are determined using a field gas chromatograph. Supporting meteorological, soil temperature, and soil moisture data also are obtained. Based on data from the fall of 1985 and the spring, summer, and fall of 1986, soil gas pressures at all depths responded to changes in barometric pressure; however, the type of response varied, depending on soil moisture and temperature. During warm, dry weather, for example, soil gas pressures in the cover and the top of the refuse equilibrate rapidly with barometric pressure, indicating that diffusion is the major mechanism for gas transport at that time (no pressure gradients). The rate of diffusional flow depends on the properties of the cover materials, as well as the concentration gradients. Increases in soil moisture, in particular, decrease the gas-filled porosity of the cover materials and retard gas movement. Our results suggest that design and maintenance of tighter landfill covers should be considered at sites where gas recovery is anticipated, to prevent loss of methane and influx of oxygen.

**37825 (DP-MS—86-155) Remote sensing at Savannah River.** Corey, J.C. (Savannah River Lab., Aiken, SC (USA)). 1986. Contract AC09-76SR00001. 17p. (CONF-8611163—1). NTIS, PC A02. File Number DE87011175.

From Water and Pollution Control Association of South Carolina fall conference; Myrtle Beach, SC, USA (5 Nov 1986).

The paper discusses remote sensing systems used at the Savannah River Plant. They include three ground-based systems: ground penetrating radar, sniffers, and lasers; and four airborne systems: multispectral photography, lasers, thermal imaging, and radar systems. (ACR)

**37826 (DPST—85-704) F-Area Seepage Basins: Environmental information document.** Corbo, P.; Killian, T.H.; Kolb, N.L.; Marine, I.W. (Savannah River Lab., Aiken, SC (USA)). Dec 1986. Contract AC09-76SR00001. 245p. NTIS, PC A11/MF A01; 1; GPO Dep. File Number DE87011220.

This document provides environmental information on postulated closure options for the F-Area Seepage Basins at the Savannah River Plant and was developed as background technical documentation for the Department of Energy's proposed Environmental Impact Statement (EIS) on waste management activities for groundwater protection at the plant. The results of groundwater and atmospheric pathway analyses, accident analysis, and other environmental assessments discussed in this document are based upon a conservative analysis of all foreseeable scenarios as defined by the National Environmental Policy Act (40 CFR 1502.22). The scenarios do not necessarily represent actual environmental conditions. This document is not meant to represent or be used as a regulatory closure plan or other regulatory sufficient document. Technical assistance in the environmental analyses of waste site closures was provided by Clemson University; GeoTrans, Inc.; JBF Associates, Inc.; S.S. Papadopulos and Associates Inc.; Radiological Assessments Corporation; Rogers and Associates Engineering Corporation; Science Applications International Corporation; C.B. Shedrow Environmental Consultants, Inc.; Exploration Software; and Verbatim Typing and Editing.

37827 **(PB—87-173175/XAB) Studies of a method of wetland reconstruction following phosphate mining. Final report.** Brown, M.T.; Odum, H.T. (Florida Univ., Gainesville (USA). Center for Wetlands). Sep 1985. 81p. NTIS, PC A05/MF A01.

The successful restoration of wetland ecosystems following surface mining is among the Florida phosphate industry's highest priorities. After nearly a decade of wetland reclamation research, the most-reliable rehabilitation technique to have emerged is spreading organic topsoil from a donor wetland being disturbed onto a recontoured wetland basin being reclaimed. The report quantifies the establishment and survival of wetland plants on a reclaimed wetland area in north Florida that had been treated with salvaged peat. The value of spreading the soil is considered from three perspectives: the influence of thickness, the pattern of application, and the cost of excavating, transporting and spreading. The research concludes that proper hydroperiod is one of the most critical parameters that must be controlled in reclaiming wetlands.

37828 **(UCRL—15873) Vegetation of Site 300, Lawrence Livermore National Laboratory, San Joaquin County, California.** Taylor, D.W.; Davilla, W. (BioSystems Analysis, Inc., Santa Cruz, CA (USA)). Nov 1986. Contract W-7405-ENG-48. 82p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87011345.

Lawrence Livermore National Laboratory (LLNL) administers and operates an approximately 28 km² (10.9 mi², 7000 acre) test site known as Site 300. This expanse of rolling hills and canyons supports a diverse array of grassland communities typical of lowland central California. The report quantitatively describes the variation of vegetation within Site 300, and relates vegetation to potential environmental impacts associated with present operation and possible expansion of on-site facilities.

37829 **Channel model of flow through fractured media.** Tsang, Y.W.; Tsang, C.F. (Lawrence Berkeley Lab., CA). *Water Resources Research;* **23**: No. 3, 367-479(Mar 1987). Contract AC03-76SF00098.

On the basis of a review of recent theoretical and experimental studies of flow through fractured rocks, the authors have studied the fluid flow and solute transport in a tight fractured medium in terms of flow through channels of variable aperture. The channels are characterized by an aperture density distribution and a spatial correlation length. Aperture profiles along the channels are statistically generated and compared to laboratory measurements of fracture surfaces. Calculated tracer transport between two points in the fractured media is by way of a number of such channels. Tracer breakthrough curves display features that correspond well with recent data by Moreno et al., which lends support to the validity of our model. Calculated pressure profiles along the channels suggest possible measurements that may be useful in identifying the geometrical characteristics of the channels. Finally, predictions were made for tracer breakthrough curves in the case of single fractures under various degrees of normal stress. These suggest possible laboratory experiments which may be performed to validate this conceptual model.

37830 (CONF-8608141—, pp 224-233) **Determination of bank widening and accretion rates and vegetation recovery along modified West Tennessee streams.** Hupp, C.R. (Geological Survey). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Woody plants, growing along modified stream channels, provide an accurate tool for estimating dates and rates of bank failure, amounts and rates of bank accretion, and dates of initial bank stability. Channel widening rates as much as 2.4 meters per year occur in response to channelization. Mean bank accretion rates up to 7 centimeters per year occur along modified channels following bed degradation and most channel widening. Establishing vegetation appear to enhance bank stability and are good indicators of stabilizing conditions (pioneer species), particularly black willow, river birch, box elder, and sycamore (Platanus occidentalis). System wide geomorphic and dendroecologic study allows for detailed interpretation of channel evolution following channel modifications. 16 references, 5 figures, 3 tables.

37831 (CONF-8608141—, pp 243-248) **Potential for use of cottonwoods as indicators of past floods.** Clark, S. (Univ. of Arizona, Tucson). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Knowledge of the flood history of watersheds is important for several purposes, including reconstructing dates of floods before periods of record or in areas where no records exist, and for studying rates of erosion and deposition. Dendrochronology can be used to establish dates and extents of past floods. Trees may be damaged by flood waters; the resulting injuries will affect growth, showing up as anomalies in the ring-width patterns. in the southwestern US, cottonwoods are often the only large trees found along streams. However, cottonwoods have not been used in any dendrochronological study until now. Reasons for this include difficulty in determining ring boundaries, uncertainty if growth rings are annual, and doubt whether riparian species are limited by water stress. After devising a method using transmitted light to see ring boundaries more clearly, collecting cores from the same trees in two consecutive years to determine that the rings are annual, and establishing that the cores cross-date, the authors attempted to discover what the cottonwoods are responding to. Preliminary results suggest that suppression events occurring in cottonwoods correspond to years of known floods. High water or partial burial of a tree can cause a decrease in growth because less oxygen is available to the roots and there are stresses from the sediment. Cottonwoods can also be used to study rates of sediment deposition. The sampled trees are buried to a depth of 2-4m, indicating that this much material has accumulated since they began growing approximately 130 years ago. 11 references, 3 figures.

37832 (CONF-8608141—, pp 249-260) **Cypress tree-ring analysis in relation to wetlands and hydrology.** Duever, M.J.; McCollom, J.M. Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

In recent years, bald cypress, Taxodium distichum, has proved to be an extremely useful species in studies involving tree-ring analysis, wetlands, and hydrology. In this paper the authors illustrate the application of tree-ring analysis using bald cypress, to

the resolution of a variety of ecological problems related to wetlands and hydrology. At Corkscrew Swamp Sanctuary, tree-ring analysis provided information on cypress forest structure and dynamics, and how they are related to substrate characteristics, water level fluctuations, site quality, and fire. They were also able to determine the most likely cause of saltwater intrusion into the Loxahatchee River estuary, where a severe dieback of the floodplain forest had occurred, and whether the area impacted had stabilized or was continuing to expand upstream. In another study at Corkscrew Swamp, they were able to assess sanctuary management practices involving water level manipulation. The authors found that year-round inundation adversely affects cypress growth. Cypress recovered quickly when an annual drydown was reestablished following a single year of continuous inundation, but recovery was slower following five years of continuous inundation. 15 references, 7 figures.

37833 **(CONF-8703144—1) Temporal variation in regulation of production in a pelagic food web model.** Bartell, S.M.; Brenkert, A.L.; O'Neill, R.V.; Gardner, R.H. (Oak Ridge National Lab., TN (USA); Science Applications, Inc., Oak Ridge, TN (USA)). 1987. Contract AC05-84OR21400. 40p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87008803.

From Symposium on complex interactions in lake communities; Notre Dame, IN, USA (21 Mar 1987).

We examined the implications of differential resource use and predator-prey relations in a seasonal environment, formalized as a pelagic food web model, on temporal changes in the relative importance of bottom-up and top-down structuring of the phytoplankton. Detailed analyses of the model's behavior were used to identify periods when control of production shifted from interspecific interactions among the phytoplankton to cascading trophic interactions.

37834 **(DOE/BP—847) Pacific Northwest Rivers Study: Idaho information update and retrieval system: user's manual.** (Idaho Dept. of Fish and Game, Boise (USA). Program Coordination Bureau). Jun 1987. 159p. NTIS, PC A08/MF A01; 1; GPO Dep. File Number DE87011911.

The RIVERS program provides easy public access to the information stored in the RIVERS data base, and allows for easy maintenance of the data base by a user friendly menu system. The RIVERS program allows access in printed report form or interactively. Yearly updates are verified and checked for errors before submission to the statewide data base.

37835 **(PB—87-182135/XAB) Workshop to assess possible systems for tracking large cetaceans held at Seattle, Washington on 24-26 February 1987. Workshop report.** Montgomery, S. (Marine Mammal Commission, Washington, DC (USA)). Apr 1987. 61p. (OCS/MMS—87/0029). NTIS, PC A04/MF A01.

Reliable information on seasonal movements and habitat use patterns is necessary to adequately assess the possible effects of offshore oil and gas development and other human activities on endangered cetaceans. Many cetaceans live in remote, open-ocean, and ice-covered areas that are difficult, expensive, and sometimes dangerous to survey by ship and aerial transits, the methods that historically have been used to determine and monitor distribution and abundance. In such areas, information on movements and other variables possibly can be obtained more cost effectively and with less danger to researchers by using satellite-monitored radio tags attached to representative samples of animals.

37836 **(TR-EL—82-4/82-11-72) Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (Gulf of Mexico): Sand seatrout and silver seatrout.** Sutter, F.C.; McIlwain, T.D. (National Wetlands Research Center, Slidell, LA (USA); Gulf Coast Research Lab., Ocean Springs, MS (USA)). Mar 1987. 21p. NTIS, PC A02/MF A01. File Number TI87900645.

Sand seatrout are one of the most abundant fishes in the estuarine and nearshore areas of the Gulf of Mexico. Although silver seatrout are also abundant, little research has been conducted for this species. Sand seatrout spawn in lower estuarine environments or in nearshore gulf waters with two spawning peaks; one in spring, and another in late summer. Silver seatrout follow a similar reproductive pattern. Sand seatrout are common in bays, sounds, and shallow offshore gulf water, while silver seatrout are more abundant in deeper waters. Both seatrout are important components in the industrial bottom fisheries; sand seatrout also are a valuable recreational species. Shrimp and other crustaceans are most commonly eaten by small sand and silver seatrout, while larger fish shift to a more piscivorous diet. Small sand seatrout are usually found in waters with temperatures greater than 15°C and salinity values less than 15 ppt, while larger fish are found over a wider temperature range (5° to 30°C), and in salinities greater than 15 ppt. Silver seatrout generally prefer waters with salinities greater than 25 ppt with temperatures ranging from 5° to 30°C.

37837 **(AD-A—179076/5/XAB) Testing to determine relationship between explosive-contaminated sludge components and reactivity. Final report, June 1985-January 1987.** Kristoff, F.T.; Ewing, T.W.; Johnson, D.E. (Little (Arthur D.), Inc., Cambridge, MA (USA)). 31 Jan 1987. 77p. (ADL—54141). NTIS, PC A05/MF A01.

Explosives manufacture and ammunition load, assembly and pack (LAP) operations result in the generation of explosives-contaminated wastewater. Over the years, the Department of the Army has used lagoons for treatment of these wastewaters by evaporation/percolation. These lagoons contain the remaining explosives-contaminated waters and sludges are listed as hazardous wastes under Federal regulations promulgated under the Resource Conservation and Recovery Act (RCRA). The basis for this listing is the assumed explosive reactivity of these wastes if subjected to a strong initiating source or if heated under confinement. The objective of this study was to investigate and define the reactivity of explosive-contaminated soils to flame and shock as a function of explosive composition using the Bureau of Mines (BOM) Zero Gap (shock) and Deflagration to Detonation Transition (DDT flame) tests. The resultant technical data will be used to define the reactivity of explosive-contaminated soil on the basis of compositional analyses. Extensive testing was conducted to investigate and define the reactivity of explosive-contaminated soils to flame and shock stimuli. From these tests, it is also concluded that explosive-contaminated soils can be diluted with virgin soil to reduce the total explosive content of $<$ or $=$ 12% and result in a composition which is not reactive in the BOM flame and shock tests.

37838 **(CONF-8703141—1-Summ.) Resistance and resilience of pond and stream ecosystems to toxicant stress: Project summary.** Boston, H.L.; Stewart, A.J.; Johnson, A.R.; Bartell, S.M. (Oak Ridge National Lab., TN (USA)). 1987. Contract AC05-84OR21400. 14p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87008804.

From EPA all-investigators meeting; Athens, GA, USA (23 Mar 1987).

This project will evaluate hypotheses concerning the resistance and resilience of aquatic ecosystems exposed to toxic chemicals. Our goals are to develop diagnostic criteria for ecosystem classification and to improve existing methods of ecological risk estimation. The development of models that predict ecosystem level effects requires quantifying the relationships between the underlying control structure of ecosystems (patterns of energy and material flux) and the contributions of thos structures to ecosystem resistance and resilience. We address these problems through an integration of manipulative experiments, multidimensional state space analysis, and ecosystem modeling. These studies will quantify the underlying rate structure in pond and stream systems (including, production, herbivory, nutrient uptake and recycling) and will measure changes in their structures in response to perturbations by toxicants.

37839 **(PB—87-175311/XAB) Water-quality-modeling software available from US EPA (Environmental Protection Agency).** Barnwell, T.O.; Vandergrift, S.B.; Ambrose, R.B. (Environmental Protection Agency, Athens, GA (USA). Environmental Research Lab.). Mar 1987. 16p. (EPA—600/M-87/007). NTIS, PC A02/MF A01.

Water quality models are used in conducting evaluations of waste loads from point and nonpoint sources and in pollutant-exposure assessments. To encourage the wider application of these techniques, the Office of Research and Development of the U.S. Environmental Protection Agency established the Center for Water Quality Modeling to provide a focal point for water quality modeling activities. The Center supports several modeling techniques and computer programs for water quality analysis ranging from techniques appropriate for preliminary analysis to sophisticated models for detailed planning. The paper describes the models supported by the Center and presents an overview of the Center's activities, which include distribution and maintenance of computer programs, training of users, and sponsorship of a users group.

37840 **(PB—87-176269/XAB) Availability and distribution of heavy metals, nitrogen, and phosphorus from sewage sludge in the plant-soil-water continuum.** Rappaport, B.D.; Scott, J.D.; Martens, D.C.; Reneau, R.B.; Simpson, T.W. (Virginia Polytechnic Inst. and State Univ., Blacksburg (USA). Virginia Water Resources Research Center). 1987. 106p. (VPI-VWRRC-Bull—154). NTIS, PC A06/MF A01.

Research was conducted during 1984 and 1985 to determine Cd, Cu, N, Ni, P, and Zn availabilities to barley (Hordeum vulgare) and corn (Zea mays) grown on four sludge-amended soils. An aerobically digested sewage sludge, which was dewatered for approximately 2 years on sandbeds, was obtained from a sewage-treatment plant with major industrial inputs. A 14-day anaerobic N incubation study indicated that mineralization of sludge organic N varied from 9.2% at the 42 Mg ha(-1) sludge rate to 4.2% at the 210 Mg ha(-1) rate. This relatively low percentage of N mineralized from the sludge may reflect the inhibitory effects of the high sludge-metal levels on N transformations and the changes in sludge composition during long-term dewatering on sandbeds. Sludge application increased crop yields, except where the amounts of N mineralized from the sludge was inadequate to supply the N requirement of the crop. Crop yields were not decreased by either metal phytotoxity or P deficiency on the four sludge-amended soils.

37841 **(PB—87-176277/XAB) Evaluating potential groundwater contamination from contaminated soils.** Pratt, J.R.; McCormick, P.V.; Pontasch, K.W.; Cairns, J. (Virginia Polytechnic Inst. and State Univ., Blacksburg (USA). Virginia Water Resources Research Center). 1987. 37p. (VPI-VWRRC-Bull—155). NTIS, PC A03/MF A01.

Contamination of soils at toxic and hazardous-waste sites can adversely affect groundwater and surface water. Water-soluble materials can move in soil by leaching and percolation and by runoff. The project evaluated the toxicity of leachable toxicants from seven soils, five of which were obtained from designated toxic or hazardous-waste sites. Acidified, dechlorinated tap water was used to extract toxic materials from surface soils. Extracts were used as complex mixtures in acute-toxicity tests using Daphnia and in chronic-effect tests using microcosms. Three classes of effects were observed. Some leachates (including control soils) showed no toxicity. Some soil leachates had moderate acute toxicity (50-80% diluted leachate) and no chronic toxicity. Very toxic soils showed both acute and chronic toxicity at <3% leachate. Toxicological evaluations of contaminants in waste-site soils can provide information not available from chemical analyses and may be useful in verifying the effectiveness of cleanup effort.

37842 **(PB—87-178273/XAB) Practical manual for determining settling rates of ocean-disposed sewage sludge. Technical memo.** Tennant, D.A.; Walker, S.L.; Lavelle, J.W.; Baker, E.T. (Pacific Marine Environmental Lab., Seattle, WA (USA)). Feb 1987. 35p. (NOAA/TM-ERL-PMEL—69). NTIS, PC A03/MF A01.

The purpose of the manual is to describe a practical approach to the measurement of the size and settling velocity characteristics of sewage-sludge particles in seawater. Three measurement sequences are required for complete characterization, but each can be performed separately according to the goals or needs of the user. The first measurement sequence provides percent total solids and some size characterization of the material. The second set of measurements results in a settling velocity distribution of the larger (coarser) fraction of the sludge. The third sequence of measurements is intended to provide a settling velocity distribution for the fine fraction of sludge particulates. The user of the manual must first decide how much information about his samples is needed.

37843 **(PB—87-181582/XAB) Effects of acidification on stream ecosystems.** Burton, T.M.; Stanford, R.M.; Allan, J.W. (Michigan State Univ., East Lansing (USA)). 1982. 30p. NTIS, PC A03/MF A01.

Pub. in Acid Precipitation: Effects on Ecological Systems, 209-235(Mar 1982.

The purpose of the paper is to summarize known effects of acid precipitation on stream ecosystems, with emphasis on the Great Lakes region. Unfortunately, very little research has been conducted on streams in much of the Great Lakes region. Thus, data are utilized from other regions of the United States as well as from Norway, Sweden, and elsewhere; from laboratory studies on effects of pH on biota; and from the authors own research on effects of pH on soft-water streams in Michigan to summarized probable effects on stream ecosystems within the region.

37844 **(PB—87-182630/XAB) National Surface Water Survey: Western Lake Survey-Phase 1 (synoptic chemistry) field operations report.** Bonoff, M.B.; Groeger, A.W. (Lockheed Engineering and Management Services Co., Inc., Las Vegas, NV (USA)). Apr 1987. 30p. NTIS, PC A03/MF A01.

The Western Lake Survey-Phase I was conducted during the fall of 1985 as a synoptic chemical survey to characterize lakes located in regions of the western and northwestern United States thought to be potentially susceptible to the effects of acidic deposition. The Western Lake Survey is part of Phase I of the National Surface Water Survey which is designed to assess the problem of acidic deposition on a national scale. The document describes the planning and execution of the Western Lake Survey-Phase I field sampling and field laboratory operations.

37845 **(PB—87-186292/XAB) Great Lakes water-quality agreement: an evolving instrument for ecosystem management. Final report.** (National Research Council, Washington, DC (USA). Water Science and Technology Board). 1985. 245p. NTIS, PC A11/MF A01.

A review of the 1978 Great Lakes Water Quality Agreement between the United States and Canada was undertaken beginning in 1984 and ending with the issuance of a final report from a binational committee of the Royal Society of Canada and the National Research Council in December 1985. A major opportunity to review the Agreement comes in 1986 after the International Joint Commission (IJC) issues its third biennial report, and the committee's report can be a valuable resource in such a review. The report covers four major areas concerning the Lakes and the Agreement: enrichment, toxic contaminants, institutional arrangement and the ecosystem approach and sustainable development.

37846 **(TVA/ONRED/AWR—87/25) Concentrations of PCBs, DDTr, and metals in fish from Tellico Reservoir.** Dycus, D.L.; Hickman, G.D. (Tennessee Valley Authority, Knoxville (USA). Office of Natural Resources and Economic Development; Tennessee Valley Authority, Knoxville (USA). Div. of Air and Water Resources). Nov 1986. 40p. NTIS, PC A03/MF A01. File Number DE87900852.

A study was initiated in autumn 1985 to examine levels of selected contaminants in composited flesh from channel catfish, largemouth bass, and carp and livers from channel catfish. Fish were collected in, upstream of, and downstream of the area of the reservoir where industrial development is expected to occur. Results showed levels of DDTr were low in all species from all locations. PCB levels were low in largemouth bass and carp but not in channel catfish. Four of the 12 composite channel catfish samples exceeded the Food and Drug Administration tolerance of 2.0 μg/g

(max 3.2 μg/g and only one sample had a level less than 1.0 μg/g. There was no statistically significant difference in PCB levels among the four sample locations, although there was a tendency toward high levels at downstream locations. Further examination of PCB levels in catfish was recommended. Of all the metals on the EPA priority list, only Cr, Ni, and Hg were found in significant amounts. Catfish analyzed for PCB should also be analyzed for metals.

37847 **Ground-water temperature fluctuations at Lyons Ferry Fish Hatchery, Washington.** Oberlander, P.L.; Myers, D.A. (Battelle Pacific Northwest Lab., Richland, WA). *Water Resources Bulletin;* **23**: No. 3, 487-492(Jun 1987).

The well field serving the Lyons Ferry Fish Hatchery has experienced reduced water temperatures following continued, periodic withdrawal of large volumes of water. In January 1985, the well field temperature was 49°F, which is less than the optimal 52°F for raising salmon and steelhead trout. The aquifer supplying the hatchery is in hydraulic and thermal connection with the Snake River and a flooded embayment of the Palouse River. Groundwater temperatures in the well field cycle on an annual basis in response to changes in surface water temperature and pumping rate. Numerical simulation of the well field, using a simplified mixing cell model, demonstrates the coupling of well field hydraulics and aquifer thermal response. Alternative pumping schedules indicate that it is feasible to adjust ground-water pumping to effectively store heat in the aquifer during the summer months when surface water temperatures are elevated. Sensitivity analysis of this model indicated that the primary controls of the system's thermal response are the volume of the aquifer assumed to contribute to the well field and temperature of the overlying surface water body.

## 5203 Radioactive Materials Monitoring And Transport

37848 **(CONF-8704123—2) An improved method for the simultaneous determination of $^{224}$Ra, $^{226}$Ra and $^{228}$Ra in water, soils and sediments.** Lucas, H.F. (Argonne National Lab., IL (USA)). 1987. Contract W-31109-ENG-38. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011415.

From Conference on radon, radium, and other radioactivity in ground water: hydrogeologic impact and application to indoor airborne contamination; Somerset, NJ, USA (7 Apr 1987).

The naturally occurring concentrations of radium ($^{226}$Ra and $^{228}$Ra) in public and private water supplies have been studied for many years. Both general surveys ad local studies have established the geographical regions where well waters exceed 3 pCi/L (1-17). In general, the $^{226}$Ra was determined by the emanation method, while the $^{228}$Ra was determined from the beta activity of the $^{228}$Ac daughter. In a recent review (18) of the methods used "a number of approved analytic methods can bear improvement, especially the method for 228Ra." The purpose of the work described here was to develop an improved method for the simultaneous determination of $^{226}$Ra and $^{228}$Ra. 22 refs., 3 tabs.

37849 **(EPS—3-PG-1) Radioactivity in coal, ashes and selected wastewaters from Canadian coal-fired steam electric generating stations.** (Dearborn Environmental Consulting Services (Canada)). Sep 1985. 189p. Dearborn Environmental Consulting Services, Canada.

The objective of this study was to examine the radioactivity in coal, ashes and related wastewater streams at Canadian steam electric generating stations. The kinds of radioactive substances which occur naturally in coal formations, the nature of their emissions, and existing information on their behaviour, and their effects on environmental organisms are also reviewed. Although the releases in wastewaters from the six stations studied were found to be low, there is no information on the long-term effects from such low-level releases. It is recommended that further studies be conducted in this area. 174 references.

37850 **(NUREG/CR—4615-Vol.2) Modeling study of solute transport in the unsaturated zone: Workshop proceedings.** Springer, E.P.; Fuentes, H.R. (eds.). (Los Alamos National Lab., NM (USA); Texas Univ., El Paso (USA). Dept. of Civil Engineering; Nuclear Regulatory Commission, Washington, DC (USA). Div. of Waste Management). Apr 1987. Contract W-7405-ENG-36. 248p. (LA—10730-MS-Vol.2; CONF-8606304—Vol.2). NTIS, PC A11/MF A01 - GPO. File Number TI87009181.

From Workshop on modeling of solute transport in the unsaturated zone; Los Alamos, NM, USA (19 Jun 1986).

Issues addressed were the adequacy of the data for the various models, effectiveness of the models to represent the data, particular information provided by the models, the role of caisson experiments in providing fundamental knowledge of porous-media water flow and solute transport, and the importance of geochemistry to the transport of nonconservative tracers. These proceedings include the presentations made by each of the modelers; the summary document written by the panel; and a transcript of the discussions, both the discussions that followed individual presentations and the general discussion held on the second day. This publication completes the series on the workshop. Volume I in the series (NUREG/CR-4615, Vol. I) contains background information and the data sets provided each modeler.

37851 **(PB—87-185088/XAB) Source of gross-alpha radioactivity anomalies in recharge wells, central Florida phosphate district. Final report.** Oural, C.R.; Brooker, H.R.; Upchurch, S.B. (University of South Florida, Tampa (USA)). Jan 1986. 100p. NTIS, PC A05/MF A01.

The central Florida phosphate industry utilizes recharge wells to mitigate withdrawals of water from the Florida aquifer and to dewater the surficial aquifer prior to mining. From a water-management point of view, these wells are efficient and serve a vital function. Recent monitoring of the radiation environment in these wells, however, casts doubts on the safety of the wells. While most of the wells conform to state and federal standards for radium, gross-alpha radiation frequently exceeds standards. The purpose of the study was to determine the radionuclide(s) responsible for the high gross-alpha radiation and to identify a method for sampling of the recharge wells that would standardize data across the phosphate district. It was found that excess gross alpha is primarily due to polonium-210. Since gross alpha and polonium-210 measurements are quite sensitive to methods of sample collections, preservation and analyses, standard procedures for sample processing are presented in the report.

37852 **(UCID—20754) Concentrations of radionuclides in fish collected from Bikini Atoll between 1977 and 1984.** Noshkin, V.E.; Wong, K.M.; Eagle, R.J.; Jokela, T.A.; Brunk, J.A. (Lawrence Livermore National Lab., CA (USA)). Jul 1986. Contract W-7405-ENG-48. 62p. NTIS, PC A04/MF A01. File Number DE87011905.

This report summarizes all available data on the concentrations of radionuclides in fish from Bikini Atoll between 1977 and 1984. As found in other global studies, $^{137}$Cs is most highly accumulated in edible flesh of all species of fish, the lowest fractions are found in the bone or liver. The mean concentration of $^{137}$Cs in muscle of reef fish from the southern part of the atoll is comparable to the global fallout concentration measured in market samples of fish collected from Chicago, Illinois, in 1982. $^{90}$Sr is generally associated with non-edible parts of fish, such as bone or viscera. Twenty-five to fifty percent of the total body burden of $^{60}$Co is accumulated in the muscle tissue; the remainder is distributed among the liver, skin, and viscera. The mean concentration of $^{60}$Co in fish has been decreasing at a rate faster than radiological decay alone. Most striking is the range of $^{207}$Bi concentrations among different species of fish collected at the same time and place. Highest concentrations of $^{207}$Bi were consistently detected in the muscle (and other tissues) of goatfish and some of the pelagic lagoon fish. In other reef fish, such as mullet, surgeonfish, and parrotfish, $^{207}$Bi was usually below detection limits by gamma spectrometry. Over 70% of the whole-body activity of $^{207}$Bi in goatfish is associated with the muscle tissue, whereas less than 5% is found in the muscle of mullet and surgeonfish. Neither $^{239+240}$Pu nor $^{241}$Am is significantly accumulated in the muscle tissue of any species of fish. Ap-

parently, $^{238}Pu$ is in a more readily available form for accumulation by fishes than $^{239+240}Pu$. Based on a daily ingestion rate of 200 q of fish flesh, dose rates to individuals through the fish-food ingestion pathway are well below current Federal guidelines.

37853 **(UCID—21031) Tritium in groundwater at Site 300.** Buddemeier, R.W.; Ruggieri, M.R.; Oberdorfer, J.A. (Lawrence Livermore National Lab., CA (USA)). Apr 1987. Contract W-7405-ENG-48. 190p. NTIS, PC A09/MF A01; 1; GPO Dep. File Number DE87011695.

This report presents the results and conclusions to date of the continuing investigation of groundwater tritium contamination in the vicinity of landfills and an experimental facility. A program of monitoring groundwater, soil moisture, and rainfall in the study area has produced new insights into hydrogeology and contaminant migration in the Pit 7 landfill complex. Groundwater recharge in the area is highly episodic and appears localized in an area to the west of the landfills. The additional data obtained support the hypothesis that tritium was released from the landfills as a result of flooding due to rising water table during a period of unusually high precipitation in 1982 and 1983. Groundwater and tritium migration velocities have been determined for the landfill plumes by a variety of methods: direct observation of tritium movement, retrospective analysis of tritium displacement, and calculation of water velocities from field determinations of hydraulic gradient and hydraulic conductivity. The most probable values for the Pit 3 and Pit 5 plumes are in the range of 5 to 20 meters/year, with an upper limit of 60 m/y in the case of the Pit 5 plume. Analytical models have been used to predict and explore the probable behavior of the landfill plumes. By using a conservative velocity value of 30 m/y and other model parameters selected to fit the observed plumes, decay-corrected tritium activities are shown to fall below the drinking water standard before either plume reaches the Site 300 boundary. Tritium above background levels has been found at additional locations within the second water bearing zone in the East Firing Area. This appears to represent an extension of the plume that originates near Building 850: it apparently has been transported to the East Firing Area along Doall Ravine streambed. A program of investigation is in progress to characterize the extent, transport, and probable future behavior of this plume.

37854 **(BMI/ONWI—640) Regional ground-water flow near Richton and Cypress Creek Domes, Mississippi: Annual status report for fiscal year 1984.** (Earth Technology Corp., Long Beach, CA (USA); Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation). Jun 1987. Contract AC02-83CH10140. 260p. NTIS, PC A12/MF A01; 1; GPO Dep. File Number DE87011006.

The reported work is part of an ongoing evaluation of Richton and Cypress Creek salt domes, located in Perry County, Mississippi, as potential repositories for high-level nuclear waste. This report describes the refinement of previously developed conceptual and numerical models of regional ground-water flow in the vicinity of the domes, based on extensive evaluation of all available hydrologic data and on application of a computer flow code. This report summarizes the hydrologic data used to refine the conceptual model, characterizing model boundary conditions and determining best estimates and bounds of reasonable certainty for hydraulic properties and flow in the major hydrogeologic units. Refined inputs were applied to the numerical model for calibration. GRAM (Version 3.01), a three-dimensional finite-element flow code, was used for numerical modeling. The numerical model, calibrated to measure water levels, calculated fluxes and water budgets by applying parameter estimation by least squares regression. A two-dimensional vertical slice model aided in calibrating the three-dimensional regional ground-water flow model. The report describes the calibration procedure and assesses the resulting model. The results of the data evaluation and the computer code application are described with emphasis on best estimates and bounds of reasonable certainty for ground-water flow parameters in the regional model area and on behavioral aspects of the ground-water flow system. The refined conceptual and numerical models of regional groundwater flow described in this report are not considered final. Potential work to further refine the models is outlined in the final section of the report.

37855 **(CONF-870410—33) Production and characterization of pyrolysis liquids from municipal solid waste.** Helt, J.E.; Agrawal, R.K. (Argonne National Lab., IL (USA)). Apr 1987. Contract W-31109-ENG-38. 9p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011526.

From 193. national meeting of the American Chemical Society; Denver, CO, USA (5 Apr 1987).

Bench-scale studies characterizing the liquids produced in the pyrolysis reactions are addressed for experimental results on the thermal decomposition of typical MSW components (Whatman No. 1, newsprint, kraft paper, cardboard, aspen,and pine) over a temperature range of 275 to 475°C.

37856 **(TVA/ONRED/WRF—85/1b) Aquatic environmental conditions in Chickamauga Reservoir during operation of Sequoyah Nuclear Plant: Fourth annual report, 1984.** Bruggink, D.J.; Buchanan, J.P.; Dycus, D.L.; Murray, S.A.; Ostrowski, P. Jr.; Smith, A.O.; Swor, C.T.; Tomljanovich, D.A.; Wade, D.C.; Webb, D.H. (Tennessee Valley Authority, Knoxville (USA). Office of Natural Resources and Economic Development; Tennessee Valley Authority, Knoxville (USA). Div. of Air and Water Resources). Jun 1985. 291p. NTIS, PC A13/MF A01. File Number DE87900883.

Evaluation of 1984 operational monitoring data, comparison of these data to previous operational and preoperational data, and recommendations for continuation or discontinuation of each type of study are presented in this report. Comparisons of aquatic parameters upstream and downstream of SQN showed numerous differences among stations and/or over time. Most of these differences were considered unimportant or thought to be associated with factors. Therefore, it is recommended that he following be discontinued: benthic macroinvertebrate community studies; mollusk bioaccumulation studies; fish impingement studies; fish gill net studies; and fish creel studies. Plankton studies should continue. Data are included in this volume.

37857 **(ENEA-RT/STUDI—86-3) Environmental indicators: a comparison of international trends.** Malatini, S.; Pinchera, G.C. (ENEA, Rome (Italy)). May 1986. 27 p. (In Italian). NTIS (US Sales Only), PC A03/MF A01. File Number DE87752641.

In order to preserve, mantain and reclaim environmental quality, and to assess the results of past actions, on an international as well as on a national or local level, a tested environmental accounting system is required. Usually, unlike economics or energy surveys, environment accounting, where performed, does not rely on tested sets of indicators, in single countries, or standardized, and thus comparable, at an international level. Some international agencies (OCSE, UNECE, CEE, and so on), at different degrees of advancement, are devoting great efforts to develop sets of indicators, and similar system. This article reviews achievements and trends to this aim, in some industrialized countries, as well as formulations and selected sets of indicators provided by some international agencies to assess both state and changes over time of environmental quality. Two categories of environmental survey are taken into ac-

count in this work: air quality and land quality. A first check of necessary versus available official data for land quality accounting in Italy is performed.

37858 (CONF-8608141—, pp 543-553) **Intervention detection - a systematic technique for examining shifts in radial growth rates of forest trees.** Downing, D.J.; McLaughlin, S.B. (Oak Ridge National Lab., TN). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Recent emphasis on characterizing possible changes in growth patterns of forest trees in response to environmental stress has highlighted the need for systematically evaluating the frequency, magnitude, and duration of past and recent shifts in those growth patterns. Intervention detection, an ARIMA technique for identifying the timing of significant shifts within time series, has been applied to analyze regional trends in radial growth of red spruce during the past 120 years. Intervention detection was coupled with intervention analysis, using a transfer function approach, to identify and evaluate the significance of growth shifts. This technique allows one to evaluate both short-term pulses as well as more persistent step-level changes and to concurrently characterize the frequency and timing of positive and negative shifts in growth trends. Applied to a regional red spruce data set from 69 predominantly high elevation sites with over 200 cores, this approach provided evidence that radial growth rate reductions during the past 15 years appear unique in the past 150 years of tree ring record of surviving trees. Criteria were the magnitude and duration of negative step changes and the low frequency of positive changes within this time period signaling a unique combination of events. Differences in the timing and magnitude of changes between northern and southern stands are noted. These techniques are suggested to have good potential for detecting and contrasting responses within and between other species and stands of forest trees. 17 references, 2 figures.

37860 (CONF-870523—3) **Evaluation of separation and purification processes in the antibiotic industry.** Bienkowski, P.R.; Lee, D.D.; Byers, C.H. (Oak Ridge National Lab., TN (USA)). May 1987. Contract AC05-84OR21400. 26p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87009665.

From 9. symposium on biotechnology for fuels and chemicals; Boulder, CO, USA (5 May 1987).

The different separation and purification processes for three major types of antibiotics, Penicillins, Cephalosporins and Tetracyclines will be discussed. All antibiotic, processing plants contain two majors sections, a relatively small and highly specialized fermentation section and a very large (60-80% of the plant) separation and purification section. The fermentation sections for the different antibiotics are essentially identical, except for differences in growth media and operating variables, but there are vast differences in the separation and purification sections. Several different separation methods are used including filtration, ultrafiltration, centrifugation, precipitation, extraction, chromatography and various membrane methods. Variables affecting the specific separation and purification configurations include final fermentation broth concentration, byproduct formed during fermentation, the physical properties and molecular structure of the various antibiotics and special purification requirements. Necessary reductions in the separation and purification processes required for rebuilding the antibiotic industry after a national emergency are discussed along with several relatively new separation/purification methods that hold great promise for effecting these reductions, chromatography, supercritical fluid extraction (SCF), and membranes. 35 refs., 10 figs., 2 tabs.

37861 (CONF-8704151—1) **Structure of yeast inorganic pyrophosphastase: A progress report.** Voet, D.; Bunick, G.; Jih, J.H.; Koepke, J.; Ogawa, K.; Secco, A.; Swaminathan, P.; Uberbacher, E. (Pennsylvania Univ., Philadelphia (USA). Dept. of Chemistry). 4 Apr 1987. Contract AC05-84OR21400. 5p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87011116.

From UCLA symposium: protein structure and design; Los Angeles, CA, USA (4 Apr 1987).

We have solved the x-ray crystal structure of the yeast enzyme inorganic pyrophosphatase. X-ray data was recorded at -50°C by rotation photography, the intensities determined using OSCAR, and the intensity data scaled by Fourier-Bessel scaling. The phases were determined by the SIR-SAS technique as supplemented by density modification and 2-fold symmetry averaging.

37862 (DOE/ER/13546—1) **Organization and regulation of the genes for nitrogen fixation in Rhodopseudomonas capsulata: Progress report for the period June 5, 1986-June 4, 1987.** Haselkorn, R. (Chicago Univ., IL (USA)). Mar 1987. Contract FG02-86ER13546. 4p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87010748.

This document describes research conducted between June 1986 and June 1987. Results dealing with the organization and regulation of genes in the photosynthetic bacterium Rhodobacter capsulatus includes cloning, sequencing, and demonstrating characterizing the products of genes that regulate expression of nitrogen fixation genes; the connection between DNA supercoiling mediated by DNA gyrase and nif gene expression; and mapping the entire chromosome of R. capsulatus.

37863 (DOE/EV/05854—9) **[DNA repair and the regulation of replication]: Progress report for 1983-1986.** Taylor, J.H. (Florida State Univ., Tallahassee (USA). Inst. of Molecular Biophysics). 1986. Contract AS05-78EV05854. 10p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87012153.

Base mismatches are produced either by mistakes in replication or by changes in bases that no longer form proper hydrogen bonds in the duplex. If base mismatches are not repaired before replication a mutation is fixed in one chromatid. Likewise, if repair occurs at random in the two chains, a transition will be produced in one chromatid 50% of the time. On the other hand, if some mechanism directs repair of the new chain near the replication fork, or preferentially removes the mutated base after deamination, no permanent damage is produced. Since methylation occurs at CpG sites on both chains, the mutated base in the 5mC → T transition can in theory be recognized by the methylated base on the complementary chain. Have cells evolved a repair system to recognize and preferentially remove the thymine at these potentially mutable sites? In designing experiments to test the hypothesis that such a system has evolved, we have discovered a more general effect of methylation

on strand discrimination in mammalian cells. We also discovered that nicks in the DNA have as much effect on strand discrimination in mismatch repair as methylated cytosine. Both signals are likely to be recognized by a repair complex that has evolved to repair mismatches produced by mistakes at replication forks (proofreading), where both hemimethylatyed DNA and nicks (between Okazaka pieces) are found. However, the specific configuration produced by deamination of one 5mC at methylated CpG sites in fully methylated DNA may also serve as a signal to restore the site and prevent fixation of the transition. Since some of the 5mCpG sites may have important roles in regulation and differentiation, such strand discrimination may be necessary for maintaining a relatively stable genotype.

37864 **(KFK—4196) Studies of metal binding by the iron transport protein transferrin using time differential perturbed angular correlation spectroscopy.** Then, G.M. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Genetik und Toxikologie von Spaltstoffen; Karlsruhe Univ. (T.H.) (Germany, F.R.). Fakultaet fuer Physik). Jan 1987. 120p. (In German). NTIS, PC E11; Available from NTIS as TIB/B87-07019.

The binding of the transition metal hafnium to transferrin was studied under various chemical conditions using time differential perturbed $\gamma\gamma$ angular correlation spectroscopy (TDPAC). Observing the electric quadrupole interaction of the /sup 181/Hf probe nuclei size and symmetry of the electric field gradient induced by the ligands of the metal ions can be determined. The experimental data suggest how homogeneous the binding conditions are and to which extend relaxation phenomena are involved. Due to the excellent time resolution obtained with new BaF/sub 2/ detectors the quadrupole coupling parameters of /sup 181/Hf-transferrin could be determined very accurately. Under nearly physiological conditions different binding configurations were quantitatively characterized by spectroscopic means and distinguished with high specificity.

37865 **Common loci for Agrobacterium tumefaciens and Rhizobium meliloti exopolysaccharide synthesis and their roles in plant interactions.** Cangelosi, G.A.; Hung, L.; Puvanesarajah, V.; Stacey, G.; Ozga, D.A.; Leigh, J.A.; Nester, E.W. (Univ. of Washington, Seattle). *Journal of Bacteriology;* **169**: No. 5, 2086-2091(May 1987). Contract FG06-86ER13532.

The authors isolated approximately 100 analogous EPS-deficient (Exo) mutants of the closely related plant pathogen Agrobacterium tumefaciens, including strains whose EPS deficiencies were specifically complemented by each of five cloned, R. meliloti exo loci. They also cloned A. tumefaciens genes which complemented EPS defects in three of the R. meliloti Exo mutants. In two of these cases, symbiotic defects were also complemented. All of the A. tumefaciens Exo mutants formed normal crown gall tumors on four different plant hosts, except ExoC mutants, which were nontumorigenic and unable to attach to plant cells in vitro. Like their R. meliloti counterparts, A. tumefaciens Exo mutants were deficient in production of succinoglycan, the major acidic EPS species produced by both genera. A. tumefaciens ExoC mutants also produced extremely low levels of another major EPS, cyclic 1,2-$\beta$-D-glucan. This deficiency has been noted previously in a different set of nontumorigenic, attachment-defective A. tumefaciens mutants.

37866 **Characteristics of the formation of enzyme-bound ATP from medium inorganic phosphate by mitochondrial $F_1$ adenosinetriphosphatase in the presence of dimethyl sulfoxide.** Kandpal, R.P.; Stempel, K.E.; Boyer, P.D. (Univ. of California, Los Angeles). *Biochemistry;* **26**: No. 6, 1512-1517(24 Mar 1987). Contract AS03-76ER70102.

Addition of dimethyl sulfoxide promotes the formation of enzyme-bound ATP from medium P/sub i/ by mitochondrial $F_1$ adenosinetriphosphatase that has tightly bound ADP present. Measurements are reported of medium P/sub i/ $\rightleftharpoons H^{18}OH$ exchange and of the dependence of formation of enzyme-bound ATP on P/sub i/ concentration. Attainment of an apparent equilibrium between medium P/sub i/ and bound ATP requires longer than 30 min, even though the rates of P/sub i/ binding and release after apparent equilibrium is reached would suffice for a faster approach to equilibrium. Slow protein conformational changes or other unknown modulating factors may be responsible for the slow rate of bound ATP formation. After apparent equilibrium is reached, each P/sub i/ that binds to the enzyme reversibly forms ATP about 50 times before being released to the medium. The rate of interconversion of bound ATP to bound ADP and P/sub i/ is much slower than that in the absence of dimethyl sulfoxide as measured with sufficient low ATP concentrations so that single-site catalysis is favored. Although the interconversion rate is slowed, the equilibrium constant for bound ATP formation from bound ADP and P/sub i/ is not far from unity. Dimethyl sulfoxide favors the formation of enzyme-bound ATP by promoting the competent binding of P/sub i/ to enzyme with ADP bound at a catalytic site rather than by promoting formation of bound ATP from bound ADP and P/sub i/.

37867 **Promoter and nucleotide sequences of the Zymomonas mobilis pyruvate decarboxylase.** Conway, T.; Osman, Y.A.; Konnan, J.I.; Hoffmann, E.M.; Ingram, L.O. (Univ. of Florida, Gainesville). *Journal of Bacteriology;* **169**: No. 3, 949-954(Mar 1987).

DNA sequence analysis showed that pyruvate decarboxylase (one of the most abundant proteins in Zymomonas mobilis) contains 559 amino acids. The promoter for the gene encoding pyruvate decarboxylase was not recognized by Escherichia coli, although the cloned gene was expressed at relatively high levels under the control of alternative promoters. The promoter region did not contain sequences which could be identified as being homologous to the generalized promoter structure for E. coli. Hydropathy plots for the amino acid sequence indicated that pyruvate decarboxylase contains a large number of hydrophobic domains which may contribute to the thermal stability of this enzyme.

37868 **Liquid crystalline phases in concentrated aqueous solutions of $Na^+$ DNA.** Rill, R.L. (Florida State Univ., Tallahassee). *Proceedings of the National Academy of Sciences of the United States of America;* **83**: No. 2, 342-346(Jan 1986).

Concentrated aqueous saline solutions of short (146-base-pair) DNA fragments suddenly become turbid and iridescent when the DNA concentration is slightly increased or the temperature is decreased. Microscopic examination through crossed polarizing filters shows that turbidity and iridescence is due to formation of a liquid crystalline DNA phase similar to cholesteric liquid crystals formed by other semirigid, but nonelectrolyte, chiral polymers. Several distinct textures of the liquid crystalline phase or phases are observed depending on DNA concentration, temperature, and method of sample preparation. Textures observed include spherulites with Maltese crosses, striated and highly colored ribbons, whorls of periodic interference fringes, and colored flakes. The liquid crystalline DNA phase coexists in metastable equilibrium with the isotropic phase over a relatively narrow temperature/ concentration range - approximately 175-250 mg/ml and 25-62°C (limit of measurements). At higher concentrations and temperatures above ~25°C, the solutions appear fully liquid crystalline. When concentrated solutions are cooled below room temperature, crystals form due to precipitation of supporting electrolyte. A partial phase diagram is reported for the isotropic → liquid crystal → crystal transitions of solutions of DNA in buffered saline (2 M $Na^+$). The general features of this phase diagram and the critical DNA volume fraction for formation of the anisotropic phase are consistent with the observed and theoretically predicted phase behavior of rodlike or semirigid nonelectrolyte polymers.

## 5503 Cytology

37869 (LMF—115, pp 361-366) **Alterations of bronchoalveolar lavage cytology in cynomolgus monkeys after sequential saline lavages.** Haley, P.J.; Muggenburg, B.A.; Bice, D.E. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

The effects of repeated saline bronchoalveolar lavage (BAL) were evaluated on pulmonary cell populations of cynomolgus monkeys. Saline lavage of individual lung lobes resulted in a marked rise in circulating blood neutrophils at 4 h followed by a similar

rise in lavage neutrophils at 24 h after the initial lavage. Differential cell counts of both blood and BAL samples returned to initial levels if subsequent lavages were spaced at 48 to 72 h intervals. Lymphocytes were not recruited to saline-lavaged lung lobes and BAL protein leels did not rise significantly. BAL appears to produce a transient and reversible intra-alveolar influx of neutrophils which is preceded by mobilization of bone-marrow stored neutrophils that is not detectable if lavage procedures are carried out at 72 h intervals. These observations indicate that BAL is a valid method for sampling and assessing pulmonary cellular and fluid constituents if the procedures are performed at intervals of at least 48 to 72 h apart. 7 references, 3 figures.

## 5504 Genetics

*REFER ALSO TO CITATION(S) 37862, 38007*

**37870 Isolation and genetic analysis of mutations allowing the degradation of furans and thiophenes by Escherichia coli.** Abdulrashid, N.; Clark, D.P. (Southern Illinois Univ., Carbondale). *Journal of Bacteriology;* **169**: No. 3, 1267-1271(Mar 1987). Contract FC22-83FE60339.

Successive mutations of Escherichia coli yielded a strain that was able to degrade a variety of heterocyclic oxygen- and sulfur-containing ring compounds. In particular, this strain could use both furan-2-carboxylic acid and thiophene-2-carboxylic acid as sole carbon and energy sources. Nitrogen-containing heterocyclic compounds were not degraded. This mutant was isolated by selecting first for oxidation of furan derivatives and then for thiphene degradation. Genetic analysis revealed that mutations in three novel genes, thdA (12 min), thdC (92 min), and thdD (98 min), were required for thiphene degradation. In addition, constitutively at both of the previously characterized fadR and atoC loci was required for efficient thiophene breakdown. The pathway of furan and thiophene degradation remains obscure, but the inability of the mutants to degrade 5-nitro or 5-bromo-substituted furan derivatives suggests that hydroxylation at position 5 may be involved. Thiophene derivatives were toxic when they were present at concentrations of 0.1% or greater; however, addition of trace amounts of phenylalanine plus tyrosine greatly reduced this effect.

**37871 Electron microscopy of single-stranded structures in the DNA of competent Haemophilus influenzae cells.** McCarthy, D.; Kupfer, D.M. (Brookhaven National Lab., Upton, NY). *Journal of Bacteriology;* **169**: No. 2, 565-571(Feb 1987).

Chromosomal DNAs from exponential-phase and competent cells of Haemophilus influenzae were examined by electron microscopy to determine whether the chromosome undergoes structural changes during competence development. Single-stranded gaps and single-stranded tails formed in chromosomal DNA during competence development. The generation of gaps was dependent on the rec-2 function. Since the rec-2 mutant is defective in the translocation of donor DNA, it was inferred that the gaps were involved in the translocation step of transformation. The generation of single-stranded tails was independent of the rec-1 and rec-2 genes. Therefore, these structures were assumed to play no direct role in the interaction of donor and recipient DNAs during transformation. Gaps were preferentially associated with a readily denaturable, possible A + T-rich fraction of the genome. This finding raised the possibility that hot spots for transformation might be associated with A + T-rich DNA.

**37872 Characterization of bromoethanesulfonate-resistant mutants of methanococcus voltae: evidence of a coenzyme M transport system.** Santoro, N.; Konisky, J. (Univ. of Illinois, Urbana). *Journal of Bacteriology;* **169**: No. 2, 660-665(Feb 1987). Contract FG02-84ER13241.

Mutants of Methanococcus voltae were isolated that were resistant to the coenzyme M (CoM; 2-mercaptoethanesulfonic acid) analog 2-bromoethanesulfonic acid (BES). The mutants displayed a reduced ability accumulate [$^{35}$S]BES relative to the sensitive parental strain. BES inhibited methane production from $CH_3$-S-CoM in cell extracts prepared from wild-type sensitive or resistant strains. BES uptake required the presence of both $CO_2$ and $H_2$ and was inhibited by N-ethylmaleimide and several reagents that are known to disrupt energy metabolism. The mutants showed normal uptake of isoleucine and were not cross-resistant to either azaserine or 5-methyltrypotophan and, thus, were neither defective in general energy-dependent substrate transport nor envelope permeability. Both HS-CoM and $CH_3$-S-CoM prevented the uptake of BES and protected cells from inhibition by it. The authors propose that M. voltae has an energy-dependent, carrier-mediated uptake system for HS-CoM and $CH_3$-S-CoM which can also mediate uptake of BES.

**37873 (BNL—39905) The application of a synchrotron radiation microprobe to trace element analysis.** Gordon, B.M.; Hanson, A.L.; Jones, K.W.; Kwiatek, W.M.; Long, G.J.; Pounds, J.G.; Schidlovsky, G.; Spanne, P.; Rivers, M.L.; Sutton, S.R. (Brookhaven National Lab., Upton, NY (USA); Chicago Univ., IL (USA). Dept. of Geophysical Sciences). 1987. Contract AC02-76CH00016. 3p. (CONF-8705124—2). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011304.

From TEMA-6: 6th international conference on trace elements in man and animals; Asilomar, CA, USA (31 May 1987).

Synchrotron radiation is light emitted by electrons when accelerated in a circular orbit. Properties of synchrotron radiation important to trace element analysis by x-ray fluorescence analysis include a broad, continuous and tunable energy spectrum for K- and L-shell excitation of all elements; a linearly polarized source reducing the scattered radiation backgrounds; low energy deposition in the target; and an appreciable flux in narrow energy bandwidths for chemical speciation. Experiments to date have generally used "white" continuous spectra with a low energy absorber and no focussing, but future runs will use focussing mirrors which increase intensities by a factor of more than 1000. Monochromators will be used to select the energy and bandwidths appropriate to the experiment. Detection limits for thin biomedical samples using a solid-state detector, a 0.5 mm beam and a 5 min counting interval were in the range of 30 ppB for calcium to 50 ppB for zinc. A prototype wet cell was designed, constructed and tested using cat cardiac myocytes with the result that major trace elements such as iron could be quantitated in single myocytes. The x-ray microprobe was used to localize gallium in fetal rat bone explants after being cultured in BGJ media containing 25 $\mu$M $Ga(NO_3)_3$. The high brightness of x rays from a synchrotron source makes possible the development of computerized tomography on a micrometer scale. A tomogram of a freeze-dried caterpillar head was produced in a 50 min scan. The pixel size was 30 $\mu$m using a 20-$\mu$m beam. 2 refs., 1 fig.

**37874 (BNL—39724) An introduction to the physics and instrumentation of positron emission tomography.** Bennett, G.W. (Brookhaven National Lab., Upton, NY (USA)). Jun 1986. Contract AC02-76CH00016. 22p. (CONF-8606313—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010041.

From NATO advanced study institute on cerebral blood flow and metabolism; L'Aguila, Italy (2 Jun 1986).

Positron-emitting radionuclides permit the use of electronic collimation and thus achieve higher resolution and better sensitivity than can be obtained with gamma-emitting radiotracers. The evolution of PET imaging systems can be traced from the use of opposed collimated scanning detectors, which had all the limitations of traditional single photon imaging devices, to the present systems which surround the subject with a large volume of detector material. The improvements in system resolution now approach the theoretical limitation imposed by positron-range, and angular deviation. The use of coding permits the use of shared electronics for reading our multiple detectors, which promises to decrease the cost of PET

imaging devices, at some penalty of degraded performance. Improvements in computer architectures and capabilities permit faster reconstruction of the multiple planes imaged by multi-slice imaging systems. Software for distortion correction and image processing are still under development, and the ability to map between different devices requires the coordination of efforts between different groups in the same institution. The development and validation of the mathematical models for tracer kinetic analyses will continue to occupy the attention of clinicians and scientists involved in these developments. The desire to make these devices simple and cheap enough to be used in routine patient care is occupying the attention of industry and pioneering users, but this goal has not yet been achieved. 17 refs., 15 figs., 3 tabs.

37875 **(DESY-SR—86-10) NIKOS - a system for non-invasive examination of coronary arteries by means of DSA with synchrotron radiation. Pt. 2. In-vivo investigations.** Dix, W.R.; Engelke, K.; Glueer, C.C.; Jabs, H.; Graeff, W.; Kupper, W.; Stellmaschek, K.H. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.); Hamburg Univ. (Germany, F.R.). 2. Inst. fuer Experimentalphysik). Nov 1986. 20p. NTIS, PC E07; Available from NTIS as TIB/B87-04641.

For routine investigations a non-invasive method of coronary angiography without using a catheter is necessary. When introducing the contrast medium into a peripheral vein, due to dilution in the central circulation it is not possible to get sufficiently good images of the anatomical situation with conventional radiologic equipment. These difficulties can be overcome with digital subtraction angiography (DSA) in energy-subtraction-mode at the K-absorption-edge of iodine (33.17 keV). Today only synchrotron radiation offers enough intensity for this method. The system NIKOS was developed for DSA in energy-subtraction-mode. Main parts of the system are a two beam double crystal monochromator, a scanning device, a two line photodiode detector with large dynamic range and a computer system for data acquisition and image processing. With this arrangement in-vivo investigations of 8 dogs were carried out. The resulting images show, that it should be possible to visualize human coronary arteries down to 1 mm diameter when 10-20 ml contrast medium is rapidly injected into the brachial vein. The necessary extensions of NIKOS for these investigations are under construction.

37876 (LMF—115, pp 389-393) **Mechanical and morphological evaluation of age-related changes in the Beagle spine.** Gillett, N.A.; Gerlach, R.; Cassidy, J.; Brown, S. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Age-related changes were evaluated in the spines of Beagle dogs by biomechanical testing, radiology and pathology. Thirty age-matched healthy Beagle dogs were divided into five groups having mean ages of 2, 5, 8, 11, and 14 years. Spinal radiographs of anesthetized dogs were taken prior to euthanasia and on defleshed pines following necropsy. Cervical, thoracic, and lumbar segments were tested in compression to calculate peak stress, peak strain, and elastic modulus. Adjacent spinal segments were examined histologically. Histological evidence of the disc degeneration and changes in the mechanical properties of the intervertebral disc joint preceded radiographical evidence of spondylosis. Changes in the mechanical properties of the disc space were probably a result of the disc degeneration rather than the spondylytic lesions. 3 references, 4 figures.

37877 **(NCRP—87) Use of bioassay procedures for assessment of internal radionuclide deposition: Recommendations of the National Council on Radiation Protection and Measurements.** (National Council on Radiation Protection and Measurements, Bethesda, MD (USA)). 28 Feb 1987. 88p. National Council on Radiation Protection and Measurements, 7910 Woodmont Ave., Bethesda, MD 20814. File Number TI87900845.

This report describes the conceptual framework and methodology required for proper assessments of the occurrences, magnitudes, and retentions of internal depositions of radionuclides in people. This report is a basic text to acquaint the reader with the various elements of a successful bioassay program and their limitations for health protection purposes. General information on bioassay procedures is given, as is guidance on critical elements of a bioassay program such as when bioassay is needed, who should participate, how frequently sampling should occur, how the results might be interpreted, and the limitations of bioassay data for health protection purposes. Basic principles are stressed along with general guidance for their application. Bioassay procedures, models, and interpretations can differ for each radionuclide. No attempt has been made to incorporate radionuclide-specific recommendations or models in this report. 100 refs., 6 figs., 7 tabs.

37878 **(ORNL/TM—10377) Nuclear medicine progress report for quarter ending December 31, 1986.** Knapp, F.F. Jr.; Ambrose, K.R.; Goodman, M.M.; Srivastava, P.C. (Oak Ridge National Lab., TN (USA)). Jun 1987. Contract AC05-84OR21400. 17p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87011952.

The synthesis of the 4,4′-dimethyl analogue of the model 3,3′-dimethyl fatty acid, 15-(p-iodophenyl)-3,3-dimethylpentadecanoic acid (3,3′-DMIPP), is described. The [I-125] labeled 4,4′-DMIPP was evaluated in fasted rats and surprisingly showed higher myocardial uptake and faster blood clearance than the 3,3′-, 6,6′- and 9,9′-DMIPP analogues [heart(heart:blood), % dose/gm, 30 min: 3,3′ = 5.06 (12:1), 4,4′ = 8.03 (16.7:1), 6,6′ = 2.26 (3.1:1), 9,9′= 3.06 (2.77)]. Since all analogues have the same chain length, differences in tissue uptake and clearance apparently result from the position of geminal dimethyl-branching. This report describes the development of a "kit" for the rapid, one-step radioiodination of N-(p-iodophenyl)maleimide. This work involved the coupling of 4-aminophenylmercuric acetate with maleic anhydride to give the acid amide which was then ring annulated with sodium acetate to give the N-(p-acetylmercuricphenyl)maleimide "kit." The crystalline kit is readily radioiodinated with $\{^{*}I\}I_2$ to give the N-(p-iodophenyl)maleimide protein labeling agent. Shipments of research products were made to medical cooperative programs. 2 refs., 5 figs., 1 tab.

37879 **Calmodulin and calmodulin binding proteins in amphibian rod outer segments.** Nagao, S.; Yamazaki, A.; Bitensky, M.W. (Los Alamos National Lab., NM). *Biochemistry;* **26**: No. 6, 1659-1665(24 Mar 1987).

The calmodulin (CaM) content of fully intact frog rod outer segments (ROS) has been measured using radioimmunoassay. The molar ratio between rhodopsin and total CaM in ROS is 800:1. In the absence of $Ca^{2+}$, the ROS membrane fraction contains only 4% of total ROS CaM. In contrast, in the presence of $Ca^{2+}$, 15% of total ROS CaM is found in the membrane fraction. For half-maximal binding of CaM to CaM-depleted ROS membranes, $3 \times 10^{-7}$ M $Ca^{2+}$ is required. This CaM binding is inhibited by trifluoperazine. CaM binding proteins in the ROS membrane fraction are identified by using two different methods: the overlay method and the use of 3,3′-dithiobis(sulfosuccinimidyl propionate) (DTSSP), a bifunctional cross-linking reagent. $Ca^{2+}$-dependent CaM binding proteins with apparent molecular weights of 240,000, 140,000, 53,000, and 47,000 are detected in the ROS membrane fraction by the overlay method. Anomalous, $Ca^{2+}$-independent CaM binding to rhodopsin is also detected with this method, and this CaM binding is inhibited by the presence of $Ca^{2+}$. With the bifunctional cross-linking reagent, DTSSP, three discrete proteins with molecular weights of 240,000, 53,000, and 47,000 are detected in the native ROS membrane fraction. CaM binding to rhodopsin is not detected with this method. These data suggest that both the $Ca^{2+}$-independent binding of CaM to rhodopsin and the $Ca^{2+}$-dependent binding of CaM to the M/sub r/ 140,000 protein represent binding of CaM to a site(s) which is (are) exposed only after denaturation. $Ca^{2+}$-dependent CaM binding in the cytoplasmic fraction is also evaluated with the overlay method. These data suggest that CaM and its binding proteins participate in the regulation of $Ca^{2+}$-sensitive processes primarily on the ROS disk membranes.

37880 **Epidermal growth factor-nonresponsive 3T3 variants do not contain epidermal growth factor receptor-related antigens or mRNA.** Schneider, C.A.; Lim, R.W.; Terwilliger, E.; Herschman, H.R. (Univ. of California, Los Angeles). *Proceedings of the National Academy of Sciences of the United States of America;* **83**: No. 2, 333-336(Jan 1986). Contract AC03-76SF00012.

The authors have previously isolated three independent variants of Swiss 3T3 cells that are unable to generate a mitogenic response to epidermal growth factor (EGF). Each of the variants is unable to bind $^{125}$I-labeled EGF; each lacks a functional EGF receptor. They used an antiserum to murine EGF receptor to look for an EGF-receptor gene product in wild-type 3T3 cells and in the three EGF-nonresponsive variants. No cross-reactive material could be detected in any of the three variants, either in $^{125}$I-labeled cell extracts or in [$^{35}$S]methionine metabolically labeled cells. 3T3 cells contained mRNA molecules homologous to a cDNA probe for the human EGF-receptor coding region. In contrast, no homologous RNA could be detected in any of the three variants. Analysis of genomic Southern blots of the DNA from 3T3 cells and the three EGF-nonresponsive variants indicated sequences from the EGF-receptor gene are present in the DNA of all four cell lines. These EGF-nonresponsive lines, which demonstrate proliferative responses to a variety of mitogens, will be ideal recipients for structure-function studies of the EGF receptor by transfection of the cloned gene.

## 5507 Microbiology

37881 **Self-protection of Pseudomonas syringae pv. tabaci from its toxin, tabtoxinine-β-lactam.** Knight, T.J.; Durbin, R.D.; Langston-Unkefer, P.J. (Los Alamos National Lab., NM). *Journal of Bacteriology;* **169**: No. 5, 1954-1959(May 1987).

An extracellular toxin, tabtoxinine-β-lactam (TβL), is produced by Pseudomonas syringae pv. tabaci. This toxin irreversibly inhibits its target, glutamine synthetase; yet P. syringae pv. tabaci retains significant amounts of glutamine synthetase activity during toxin production in culture. As part of our investigation of the self-protection of P. syringae pv. tabaci, the authors compared the effects of TβL on Tox$^+$ (TβL-producing, insensitive to TβL) and Tox$^-$ (TβL nonproducing, sensitive to TA) strains. The extent of protection afforded to the Tox$^-$ strain when induced to adenylylate glutamine synthetase was tested. It was concluded that an additional protection mechanism was required. A detoxification activity was found in the Tox$^+$ strain which opens the ϵ-lactam ring to TβL to produce the inactive, open-chain form, tabtoxinine. Whole cells of the Tox$^+$ strain incubated for 24 h with [$^{14}$C]TβL (0.276 μmol/3 x $10^{10}$ cells) contained [$^{14}$C]tabtoxinine (0.056 μmol), and the medium contained TβL (0.226 μmol). Extracts of spheroplasts of the Tox$^+$ stain also converted TβL to tabtoxinine, whereas extracts of the Tox$^-$ strain did not alter TβL. The conversion was time dependent and stoichiometric and was destroyed by boiling for 30 min or by the addition of 5mM EDTA. Penicillin, a possible substrate and competitive inhibitor of this lactamase activity, inhibited the conversion of TA to tabtoxinine. Periplasmic fluid did not catalyze the conversion of TβL.

37882 **Antigenic mosaic of Methanogenium spp.: analysis with poly- and monoclonal antibody probes.** Macario, A.J.L.; Dugan, C.B.; de Macario, E.C. (New York State Dept. of Health, Albany). *Journal of Bacteriology;* **169**: No. 2, 666-669(Feb 1987). Contract FG02-84ER13197.

Eight well-characterized Methanogenium strains, including the six described type strains, were analyzed with poly- and monoclonal antibody probes to examine the antigenic mosaic of the genus. The pattern of cross-reactions showed that the mosaic is complex and varies with the strains; thus, these organisms have developed a considerable antigenic diversity, which is expressed in their envelopes. Every strain shared at least one determinant with at least one other strain, demonstrating the antigenic cohesiveness of the group. This finding, together with the fact that most strains displayed a distinctive antigenic fingerprint (notwithstanding the limited number of probes available), emphasizes the potential of antibodies for rapid identification of new isolates and for direct elucidation of Methanogenium strains in microbial mixtures.

37883 (CONF-8608141—, pp 130-141) **Western spruce budworm outbreaks in northern New Mexico: tree-ring evidence of occurrence and radial growth impacts from 1700 to 1983.** Swetnam, T.W. (Univ. of Arizona, Tucson). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Douglas-fir tree-ring chronologies were analyzed for evidence of past outbreaks of western spruce budworms. Tree-ring chronologies from ponderosa pine, which is not defoliated by budworms, were used to estimate potential growth in the Douglas-fir during current and past outbreaks. At least eight outbreak periods were identified in the Douglas-fir chronologies between 1700 and 1983. The average interval between initial years of reduced growth periods caused by budworm was 33.8 years. The average duration of reduced growth periods was 14.0 years, and the average maximum and periodic growth reductions were 42.5% and 23.5% of potential growth. 17 references, 4 figures, 2 tables.

## 5510 Physiological Systems

37884 (LMF—115, pp 367-370) **Histopathology of secondary immune responses in the primate lung.** Gillett, N.A.; Mason, M.J.; Bice, D.E. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Histopathologic alterations in the lung following multiple local pulmonary immunization were studied to further investigate the hypothesis that clonal proliferation of immune memory cells within the lung is responsible for antigen responsiveness to subsequent pulmonary challenge. Two cynomolgus monkeys were immunized with sheep red blood cells (SRBC) in the right diaphragmatic lung lobe 4 times at 30 day intervals. The number of lymphocytes producing IgM anti-SRBC antibody was determined in the peripheral blood and lung lavage fluid at multiple times after each antigen challenge. On the fourth day after the fourth immunization, the monkeys were injected with $^3$H-thymidine, sacrificed after 1 h, and lung sections were prepared for histology and autoradiography. Following each challenge, there was a trend of increasing SRBC-AFC in the lung lavage fluid with a concomittant decrease in the blood response. Histologically, multiply immunized lobes exhibited numerous intraseptal perivascular cellular cuffs composed of lymphocytes and large mononuclear cells which showed an increased labeling index. These histopathology findings support the hypothesis that a local clonal expansion occurs within the lung in response to antigen challenge. 3 references, 2 figures, 1 table.

37885 (LMF—115, pp 371-376) **Effect of continuous positive and negative pressure breathing on the respiratory pattern of conscious rats.** de Madron, E.; Mauderly, J.L. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Rodents placed in plethysmographic nose-only exposure tubes may breathe against negative pressure that is maintained in the exposure chamber to avoid leakage. Since this could affect their breathing pattern, the authors measured the steady-state respiration parameters of 10 conscious rats placed in a volume-displacement tube plethysmograph with a neck-seal. The rats breathed against continuous positive of negative airway pressures of 2.5, 5, and 7.5 cm $H_2O$ in random order. Tidal volume, peak inspiratory and peak expiratory flows, minute, and alveolar ventilation were not affected by the pressure changes. However, the breathing strategy was modified. With negative pressures expiration was interrupted more vigorously by an increased diaphragmatic activity, but residual diaphragmatic activity persisted longer to prevent tidal volume from falling due to increasing stress on the expiration. 11 references, 5 figures, 1 table.

37886 (LMF—115, pp 377-381) **Effects of body position on pulmonary function of the F344/N rat.** Gerlach, R.F.; Mauderly, J.L. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Both prone and supine body positions are used for evaluating pulmonary function in anesthetized rodents. The authors measured pulmonary function of F344/N rats in both positions to aid in comparing results among laboratories. Fourteen male rats (17 wk old) from the Institute's colony were anesthetized with halothane and measured in both prone and supine positions by plethysmography. Tests included breathing patterns, lung volumes, lung mechanics, gas distribution, CO diffusing capacity and forced exhalation. The main difference was a reduced airflow resistance for rats in the supine position. There was minimal effect on other parameters. Body position appears to have less effect on the lung function of rats than observed in man and the dog. 8 references, 2 figures, 1 table.

37887 (LMF—115, pp 382-388) **Cross-sectional study of the effects of age on pulmonary function and lung morphology of Beagle dogs.** Gerlach, R.F.; Gillett, N.A.; Muggenburg, B.A.; Mauderly, J.L. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

The effects of age on dog lungs were studied to aid in distinguishing between aging and treatment effects in long-term toxicology studies. Respiratory function of 5 males and 5 females at 2, 5, 8, 11, and 14 years of age was measured. Measurements included breathing patterns, lung volumes, lung mechanics, gas distribution, gas exchange CO diffusing capacity (DLCO), blood gases, forced exhalation, and collateral resistance. Morphometric evaluations were performed on lungs of 6 dogs per group. Age-related volume changes, including decreased vital capacity, expiratory reserve volume, and increased residual volume correlated with increased volume fraction, expiratory reserve volume, and increased residual volume correlated with increased volume fraction of alveolar ducts and decreased volume fraction of alveoli. Age-related gas exchange impairment, including reduced DLCO and increased alveolar-arterial (A-a $PO_2$) difference, correlated with increased thickness of alveolar septae. There was no difference in collateral resistance even though the number and size of alveolar pores increased with age. Other changes included reduced forced vital capacity and lung compliance, increased total pulmonary resistance, and less uniform gas distribution with age. Expiratory flows were reduced with age, but were not different when normalized for lung volume. Most of these changes are similar to those occurring in man. 12 references, 3 figures, 1 table.

37888 **(PB—87-173209/XAB) Current Intelligence Bulletin reprints - Bulletins 31 through 47.** (National Inst. for Occupational Safety and Health, Cincinnati, OH (USA)). Sep 1986. 325p. (DHEW/PUB/NIOSH—86-122). NTIS, PC A14/MF A01.

See also PB—83-245845.

Current Intelligence Bulletins 31 through 47 were reprinted. Topics included are the adverse effects of smoking and the occupational environment on worker health; poisoning in the workplace by arsine; health hazards from radiofrequency sealers and heaters; evidence of carcinogenicity from formaldehyde; ethylene-oxide; silicosis from silica flour; ethylene-dibromide; vibration syndrome resulting from the operating of hand held vibrating tools; problems resulting from glycol ethers including reproductive problems among female employees and embryotoxicity; 2,3,7,8-tetrachlorodibenzo-p-dioxin poisoning; 1,3-butadiene and health-related effects among workers including reproductive effects and carcinogenesis; cadmium carcinogenesis in the workplace; monohalomethane hazards including teratogenesis and carcinogenesis; health hazards due to the use of dinitrotoluenes including cancer and reproductive defects; electrical equipment fires and potential health hazards due to polychlorinated biphenyls; methylene chloride carcinogenesis; and the potential carcinogenicity of 4,4'-methylenedianiline. A cumulative list of NIOSH Current Intelligence Bulletins numbers 1 through 47 is also included.

37889 **(PB—87-174165/XAB) Fence: where the community and the workplace meet.** Millar, J.D. (National Inst. for Occupational Safety and Health, Cincinnati, OH (USA)). 24 Feb 1986. 21p. NTIS, PC A02/MF A01.

In this presentation, the speaker discusses the apparent separation between the workplace and the community, the separation of the occupational-health problem from the community environmental-health problem and the question of jurisdiction which arises out of such attempts to separate the issue. He stresses the different origins of environmental and occupational-health considerations, reminding his audience that occupational-health concerns began as a surgical speciality, for treating workers injured on the job. In the community, concerns grew over the purity of public water supplies and adequate sanitation. Chronic problems involving both the workplace and the community include air and water pollution. The production of synthetic chemicals is continuously growing, and with this there is constant concern over exposure of workers during manufacture, use, and cleanup. The author recommends that occupational and community environmental professionals coordinate actions, and share information.

37890 **(PB—87-174207/XAB) Health-hazard evaluation report HETA 85-416-1742, Roofing and Waterproofing Sites, Chicago, Illinois.** Zey, J.N.; Stephenson, R. (National Inst. for Occupational Safety and Health, Cincinnati, OH (USA)). Oct 1986. 33p. (HETA—85-416-1742). NTIS, PC A03/MF A01.

Potential exposures to organic solvents during the application of single-ply roofing and waterproofing systems were evaluated in response to a request from the United Union of Roofers, Waterproofers, and Allied Workers. The evaluation was conducted at three sites in Chicago, Illinois where roofing contractors were using two roofing systems (ARC and Carlisle) and one waterproofing (WR Grace) system. Air concentrations of toluene, xylene, hexane, acetone, and heptane were measured. Acenaphthalene, fluorene, and naphthalene were detected in air samples collected at the ARC roofing site. Potential hazards observed at both roofing sites included falls from roofs and slipping on slick roof surfaces. Another potential source of injuries was the use of torches for installation of the ARC system. The authors conclude that personal exposures were relatively low for the chemicals evaluated. Contractors should make every effort to determine the principal components of the roofing supplies they are using. Employees should receive adequate training to work safely with the materials involved. Exposure to coal tar and pitch fumes should be minimized due to the risk of cancer.

37891 **(PB—87-176004/XAB) Preliminary evaluations of initial TSCA (Toxic Substances Control Act) Section 8(e) substantial risk notices. January 1, 1985 to December 31, 1986.** (Environmental Protection Agency, Washington, DC (USA). Office of Pesticides and Toxic Substances). Mar 1987. 471p. (EPA—560/2-87/001). NTIS, PC A20/MF A01.

See also PB—87-129409.

The volume contains, in ascending submission number order, status reports (i.e., preliminary evaluations) prepared by staff of the Office of Toxic Substances in EPA's Office of Pesticides and Toxic substances for initial submissions received by EPA from chemical manufacturers, importers, processors and distributors from January 1, 1985 to December 31, 1986 under Section 8(e), the substantial risk information reporting provision of the Toxic Substances Control Act (TSCA). The status reports contained in this compendium reflect only the initial phase of the Agency's evaluation process for the submitted information. The TSCA Section 8(e) status reports volume has been published by the Agency for two reasons. First, a volume of Section 8(e) status reports with appropriate indices will make the submitted information more accessible. Second, this

volume may, by providing specific examples of submitted information and EPA's preliminary evaluation of that information, help those persons subject to Section 8(e) understand better the types of information that should be submitted to EPA under this mandatory reporting provision of TSCA.

37892 **(PB—87-183125/XAB) Superfund public health evaluation manual.** (Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response). Oct 1986. 186p. (EPA—540/1-86/060). NTIS, PC A09/MF A01.

The Superfund Public Health Evaluation Manual has been developed for use by a diverse audience, including EPA regional staff, state Superfund program staff, federal and state remedial contractors, and potentially responsible parties. Individuals having different levels of scientific training and experience are likely to use the manual in designing, conducting, and reviewing public health evaluations. Because assumptions and judgments are required in many parts of the analysis, the individuals conducting the evaluation are key elements in the process. The manual is not intended for use by non-technical personnel to perform technical evaluations, nor to allow professionals trained in one discipline to perform the work of another. Rather, it is the responsibility of remedial project managers, using the manual as a guide, to match the scientific support they deem necessary with the appropriate resources at their disposal.

37893 (CONF-8508235—, pp 21-26) **What does a forest politician expect from forest inventory.** Steinlin, H. (Freiburg Univ., Germany, F.R. Inst. fuer Landespflege). 1985. (In German). NTIS (US Sales Only), PC A16/MF A01. File Number DE87752457.

From IUFRO conference on inventoring and monitoring endangered forests; Zurich, Switzerland (19 Aug 1985).

Forestry is seen as a social system which itself is a political system. Forest policy is defined as: 'All human activities dealing with the relations and interactions between forestry as a social subsystem and the human society of the other side'. Working methods of forest policy are: - analysis of the situation and the role of forestry in the general socio-political system - development of strategies which aim at the strengthening of forestry's position in the general socio-political system - political action aiming at the implementation of the adopted strategies (lobbying, bargaining, convincing) leading to an arrangement with partners or to a political/legal decision - continuous review of the effects or arrangements and political/legal decisions in order to adjust or improve the strategies if appropriate (feed-back). For all these activities forest policy needs a wealth of information from inside and outside of forestry. An important part of these informations can be gathered from inventories and monitoring systems. In the stage of planning and design of inventories and monitoring systems, the forest politician has to be involved in order to discuss which the inventory and how this inventory could be designed accordingly to these needs. The paper deals with several aspects of the special views of the forest politicians in contrast to the forest manager and their consequences for the collection and preparation of information through inventories and monitoring systems.

37894 (CONF-8508235—, pp 45-47) **What does the wood customer expect from inventories of endangered forests.** Hummel, F.C. 1985. NTIS (US Sales Only), PC A16/MF A01. File Number DE87752457.

From IUFRO conference on inventoring and monitoring endangered forests; Zurich, Switzerland (19 Aug 1985).

The use of inventories of endangered forests for wood customers as timber industry or some mills is briefly discussed. The economical conditions as volume and type of wood, availability, economic transport distance, continuity of supplies and scale and units of assessment are mentioned.

37895 (CONF-8508235—, pp 49-51) **What does the customer expect from inventories of endangered forests.** Bachmann, P. (Kreisforstamt, Schwarzenburg, Switzerland). 1985. (In German). NTIS (US Sales Only), PC A16/MF A01. File Number DE87752457.

From IUFRO conference on inventoring and monitoring endangered forests; Zurich, Switzerland (19 Aug 1985).

More than anything, the customer is interested in data on enterprises, stands, and individual trees. The Swiss control sampling method, for instance, yields most valuable data. To counteract the apprehension to which the new forest disease has given rise, the circumferential growth increment of trees, at breast height 1979/1985 in a municipal forest in the Berne Lower Alps was compared on 38 sampling plots with the respective increment in diameter for the period 1969/1979. In all and for the individual species, no decrease in growth increment was noted; in many cases the increment in diameter was even larger statistically than in the previous period. The example underlines the importance of an adequate method of inventory especially in our time. Surveys should therefore be improved, where possible, and their results interpreted in close cooperation with the customers.

37896 (CONF-8508235—, pp 55-59) **Review of recent FAO contributions to inventorying and monitoring of tropical forests (1979-1985).** Singh, K.D. (Food and Agriculture Organization of the United Nations, Rome, Italy). 1985. NTIS (US Sales Only), PC A16/MF A01. File Number DE87752457.

From IUFRO conference on inventoring and monitoring endangered forests; Zurich, Switzerland (19 Aug 1985).

The paper aims to describe FAO activities with particular reference to inventorying and monitoring of tropical forests. These are divided into three broad classes: Regular programmes, field programmes and unprogrammed activities. The regular programmes include maintenance and updating of global forest resources information systems and development and transfer of technology in the fields of forest inventory, remote sensing, electronic data processing and geographic information systems. The field programmes provide technical assistance, on request, to member countries. They focus on institution building, technology transfers, technical and economic development. Unprogrammed Activities include FAO participation in international meetings and seminars, replies to adhoc enquiries, and services to FAO Headquarters visitors. In conclusion, the paper emphasizes need for integrating forest inventories and monitoring with development problems and recommends following a system approach in solving them.

37897 **(IIUG-pre—85-14) Forestry and forest industries in Liberia. An example in ecological destabilization.** Dorm-Adzobu, C. (Wissenschaftszentrum Berlin (Germany, F.R.). Internationales Inst. fuer Umwelt und Gesellschaft). 1985. 25p. NTIS, PC E07; Available from NTIS as TIB/B87-06482.

The forestry sector in Liberia is the third most important sector of the national economy in terms of foreign exchange after iron ore mining and rubber production. Although the commercial exploitation of Liberia's forests only began in the mid-sixties, the forest cover has already been lost to such a degree that the extension of the Sahel drought into Liberia has become a serious threat. The risk of continuing traditional forest policy has been clearly recognized by the Liberian government and since 1973 the government has been trying to put the use of the forests on a sustainable basis. Furthermore, the slash and burn techniques of forest use by local farmers continues unabided and its impact on deforestation remains uncontrolled. As a result the ratio between reforestation and deforestation reached 1:20 in terms of acreage until 1981, but fell to 1:100 thereafter.

37898 **(ISH—35-Ed.2) Treatment of spices with ionizing radiation - chemical, organoleptical, microbiological and toxicological analyses. Pt. 1.** Schuettler, C.; Boegl, W. (Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene). Jan 1984. 260p. (In German). NTIS, PC E17; Available from NTIS as TIB/B87-04721.

Pt. 2 published as report ISH--49.

In a study of the relevant literature the results of tests on 30 radiation treated spices were evaluated. The tests contain chemical, organoleptical, microbiological and toxicological analyses. Most of the spices were treated with gamma radiation from cobalt-60 sources with doses up to 60 kGy.

37899 **(ISH—49) Treatment of spices with ionizing radiation - chemical, organoleptical, microbiological and toxicological analyses. Pt. 2.** Schuettler, C.; Boegl, W. (Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene). Sep 1984. 267p. (In German). NTIS, PC E17; Available from NTIS as TIB/B87-04683.

Pt. 1 published as report ISH--35.

In the present second part of a study of the relevant literature the results of tests on 14 radiation treated spices and 2 radiation treated spice-mixtures were evaluated. The tests in this part contain mainly toxicological but also chemical and sensorial analyses. Most of the spices were treated with gamma radiation from cobalt-60 sources with doses between 80 Gy and 60 kGy. This part contains a cumulated subject index for part 1 and part 2.

37900 **(AD-A—179688/7/XAB) Identification of Schistosoma mansoni glycoproteins recognized by protective antibodies from mice immunized with irradiated cercariae.** Dalton, J.P.; Strand, M.; Mangold, B.L.; Dean, D.A. (Johns Hopkins Univ., Baltimore, MD (USA). School of Medicine). 15 Jun 1986. 7p. NTIS, PC A02/MF A01.

Pub. in Journal of Immunology, Vol. 136, No. 12, 4689-4694(15 Jun 1986).

The humoral immune response of mice patently infected with Schistosoma mansoni and of mice vaccinated with radiation-attenuated cercariae were compared by radioimmunoassays and one-and two-dimensional polyacrylamide gel analyses of radioimmunoprecipitates. The binding observed with antibodies of mice vaccinated twice with radiation-attenuated cercariae over a period of 7 to 11 wk was less than 50% of the binding observed with antibodies of mice patently infected for 20 wk, but three to four times greater than that obtained with antibodies of mice infected for 6 wk, irrespective of whether the test extracts were derived from schistosomula or adult worms. Sera of vaccinated mice precipitated a restricted number of predominantly high m.w. glycoproteins of both schistosomula and adult worms metabolically labeled with sulfur-35 methionine. Each of the glycoproteins of 36 hr in vitro-cultured schistosomula that was precipitated by the sera of vaccinated mice was also precipitated by the sera of infected mice. Although radiation-attenuated larvae do not reach the adult stage, mice vaccinated with these still elicit a strong immune response against egg glycoproteins. These results show that the antibody response in mice vaccinated with radiation-attenuated larvae differs qualitatively and quantitatively from that of infected mice.

37901 **(CONF-8705116—2) Prediction of the mortality dose-response relationship in man.** Morris, M.D.; Jones, T.D. (Oak Ridge National Lab., TN (USA)). 1987. Contract AC05-84OR21400. 13p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87009680.

From NATO RSG5 meeting; Portsmouth, UK (11 May 1987).

Based upon an extensive data base including 100 separate animal studies, an estimate of the mortality dose-response relationship due to continuous photon radiation is predicted for 70 kg man. The model used in this prediction exercise includes fixed terms accounting for effects of body weight and dose rate, and random terms accounting for inter- and intra-species variation and experimental error. Point predictions and 95% prediction intervals are given for the $LD_{05}$, $LD_{10}$, $LD_{25}$, $LD_{50}$, $LD_{75}$, $LD_{90}$, and $LD_{95}$, for dose rates ranging from 1 to 50 R/min. 6 refs., 5 tabs.

37902 **(CONF-8705116—3) Notes on the effect of dose uncertainty.** Morris, M.D. (Oak Ridge National Lab., TN (USA)). 1987. Contract AC05-84OR21400. 5p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87009678.

From NATO RSG5 meeting; Portsmouth, UK (11 May 1987).

The apparent dose-response relationship between amount of exposure to acute radiation and level of mortality in humans is affected by uncertainties in the dose values. It is apparent that one of the greatest concerns regarding the human data from Hiroshima and Nagasaki is the unexpectedly shallow slope of the dose response curve. This may be partially explained by uncertainty in the dose estimates. Some potential effects of dose uncertainty on the apparent dose-response relationship are demonstrated.

37903 **(GSF-B—1964) Experimental tumour therapy. 1985 report. Report on the cooperation between the Institute of Radiation Biology of the University of Munich and the Institute for Radiation Biology of the Society for Radiation and Environmental Research, Neuherberg.** (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.)). Aug 1986. 127p. (In German). NTIS, PC E11; Available from NTIS as TIB/B87-06911.

The 1985 annual report documents - once again - the collaboration between the members of the University's Radiobiological Institute and the Radiobiological Department of GSF in the field of experimental radiotherapy. As in the previous years, key areas were concerned with the examination of clinically relevant radiation-induced injuries in normal tissue, the clarification of their pathogenesis and their fractionation behaviour but also possible methods of their prevention. New areas of interest included the experiments performed on rat stomach which allowed to establish a promising animal model for the radiobiological examination of this organ. Experimental tumours were continued to be studied for factors important for tumour resistance in fractionated irradiation; in this context, the high repopulation capacity of a differentiated squamous-cell carcinoma under quasi-clinical fractionation revealed to be particularly remarkable. A further key area was concerned with investigations into the combined action of cytostatics and irradiation or else hyperthermia which were mostly performed in vitro on cell cultures but also on experimental tumours and some normal tissues.

37904 **(GSI—87-2-Prepr.) Heavy-ion effects on cellular and subcellular systems: Inactivation, chromosome aberrations and strand breaks induced by iron and nickel ions.** Kraft, G.; Kraft-Weyrather, W.; Blakely, E.A.; Roots, R. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.); Lawrence Berkeley Lab., CA (USA)). Jan 1987. 10p. NTIS, PC E07; Available from NTIS as TIB/B87-04774.

A broad spectrum of particles and energies has been used in the last years to study the influence of the radiation quality i.e. of the physical parameters of the particle beam on the biological effectiveness. In these measurements a common structure of the functional dependence of the induction probability per particle (cross section) from the linear energy transfer is observed for different biological endpoints. Because of the relevance for space research, we present in this report our data from experiments with iron and nickel particles, in particular. Our experiments were designed to investigate the relationship between the inactivation and chromosome aberration in mammalian cells and the induction of single and double strand breaks in SV40 DNA in respect to the parameters of the track formation like LET and particle energy.

37905 **(ISH—92) Carbon and carbon metabolism in the environment.** Holtum, J.A.M.; Latzko, E. (Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene). Apr 1986. 144p. NTIS, PC E11; Available from NTIS as TIB/B87-04775.

The present report contains the following chapters: CO/sub 2/ and photosynthesis, carbon in the soil, carbon isotopes in the en-

vironment, and the global carbon cycle. A lot of figures and tables are presented.

37906 (LMF—115, pp 105-108) **Biokinetics of $^{239}Pu$ in immature dogs that inhaled $^{239}PuO_2$.** Guilmette, R.A.; Muggenburg, B.A.; Diel, J.H. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

In order to study the effect of age at exposure on the biokinetics of inhaled Pu, 16 immature Beagle dogs (3 months of age) received a single brief exposure to a monodisperse aerosol of $^{239}PuO_2$ (1.5 μm AMAD) at a level of 0.02 μCi/kg (0.74 kBq) body weight and are being serially sacrificed through 2 years after exposure. With radiochemical analysis completed on 10 of the 16 animals, retention functions were fitted to the lung, tracheobronchial lymph node, liver, and skeleton data. Thus far, there are no statistically significant differences in the retention of Pu in the lung and tracheobronchial lymph nodes of the immature dogs when compared to dogs that inhaled the same sized aerosol as young adults (18 months of age). There was, however, a five-fold increased amount of Pu that was initially deposited in the skeleton of the immature dog, an increase that is believed to be age-associated. Differences from the young adult dogs were also seen in the uptake and retention of Pu in liver. 2 references, 4 figures, 1 table.

37907 (LMF—115, pp 109-113) **Interactions of plutonium and americium with bone mineral.** Guilmette, R.A.; Hanlon, L.L.; Eidson, A.F.; Rothenberg, S.J. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Soluble actinides such as Pu and Am tend to deposit on bone surfaces and remain avidly attached to those surfaces in the absence of bone remodeling. To quantify the degree of binding of Pu and Am to bone mineral, known masses of the actinide citrate complexes were added to stirred suspensions of bone ash for 24 h. The amount of Pu or Am bound to the bone mineral was then determined by centrifugal ultrafiltration. The percent of Pu remaining unbound to the mineral varied between 0.03 to 0.3% for Pu masses in the range of 1 ng to 10 μg. The amount of Am remaining unbound was slightly higher, 0.04 to 1%. To determine whether calcium diethylenetriamine pentracetate (DTPA) could remove Pu or Am once it had attached to bone mineral, physiologically realistic concentrations of DTPA were added to bone ash suspensions with which Pu or Am had been allowed to react for 24 h. The suspensions were ultrafiltered after an additional 24 h. The addition of DTPA to the Pu-containing system resulted in little or no additional Pu in the filtrate, indicating the DTPA was not effective in removing Pu fixed on bone mineral. DTPA did, however, increase the amount of Am in solution in both a time- and concentration-dependent manner.

37908 (LMF—115, pp 151-157) **Toxicity studies of inhaled beta-emitting radionuclides - status report.** Hahn, F.F.; McClellan, R.O.; Boecker, B.B.; Gillett, N.A.; Hobbs, C.H.; Jones, R.K.; Lundgren, D.L.; Mauderly, J.L.; Muggenburg, B.A.; Pickrell, J.A.; Scott, B.R.; Snipes, M.B. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

The influence of total dose and dose-rate pattern on the effects of inhaled beta-emitting radionuclides is being studies in laboratory animals. The inhaled radionuclides were either in a relatively soluble form ($^{90}SrCl_2$, $^{144}CeCl_3$, $^{91}YCl_3$, or $^{137}CsCl$), or in a relatively insoluble form ($^{90}Y$, $^{91}Y$, $^{144}Ce$, or $^{90}Sr$ in fused aluminosilicate particles). The organs affected depend on the solubility and chemical characteristics of the radionuclides. Studies with young adult dogs are complemented by comparable studies in other species (mice, rats, and Syrian hamsters), with animals of different ages and animals repeatedly exposed to $^{144}Ce$. 12 references, 2 figures, 2 tables.

37909 (LMF—115, pp 158-166) **Annual report references to dog longevity studies in which all dogs have died.** Boecker, B.B. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Several of the life-span studies involving dogs that inhaled beta-emitting radionuclides have reached the point where all of the dogs have died. References to all annual report summaries for these studies are tabulated for the use of those who need further information on the significant occurrences in each of these studies and when they occurred. 5 figures, 5 tables.

37910 (LMF—115, pp 167-176) **Single inhalation exposure to $^{90}SrCl_2$ in the Beagle dog: late biological effects.** Gillett, N.A.; Muggenburg, B.A.; Boecker, B.B.; Griffith, W.C.; Hahn, F.F.; McClellan, R.O. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Young adult Beagle dogs were exposed once to aerosols containing $^{90}SrCl_2$ to obtain initial body burdens ranging from 2.5 to 250 μCi $^{90}Sr$/kg body weight (92 to 9250 kBq) and subsequently observed throughout their life span. All of the dogs are now dead. Radiation-induced lesions were confined to the bone, bone marrow, and adjacent soft tissue. Forty-five primary bone tumors occurred in 31 of 66 exposed dogs. Metastasis occurred from 21 tumors with the lung being the most frequent site of metastasis (76%). Twenty-seven were classified as different subtypes of osteosarcoma, 14 as hemangiosarcomas, 3 as fibrosarcomas, and 1 as a myxosarcoma. Four carcinomas arising from soft tissues adjacent to bone were also considered to be $^{90}Sr$-induced. In contrast to bone tumors arising in Beagle dogs chronically exposed to $^{90}Sr$ through ingestion, histologic lesions of radiation osteodystrophy were minimal in this study, indicating that these lesions are not a necessary precursor of osteosarcoma development. The incidences of hemangiosarcomas (31%) and telangiectatic osteosarcomas (11%), in addition to osteosarcomas, suggest that the cell of origin for all of these neoplasms may be a multipotent mesenchymal cell with the potential for various morphologic expressions dependent upon local environmental factors. 7 references, 1 figure, 2 tables.

37911 (LMF—115, pp 177-181) **Toxicity of $^{90}Y$ in a relatively insoluble form inhaled by Beagle dogs. XVIII.** Hahn, F.F.; Hobbs, C.H.; McClellan, R.O.; Mauderly, J.L.; Pickrell, J.A. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

The metabolism, dosimetry, and biological effects of $^{90}Y$ inhaled in fused aluminosilicate particles are being studied in Beagle dogs. Eighty-nine dogs with initial lung burdens ranging from 80 to 5200 μCi (3.0 to 190 MBq) $^{90}Y$/kg body weight and 12 control dogs are being maintained for life-span observations. The lung burdens achieved and the effective half-life of the $^{90}Y$ in this chemical form resulted in a relatively high, rapidly decreasing radiation dose rate to the lung. To date, 88 exposed dogs have died-40 from radiation pneumonitis, 10 from pulmonary neoplasms, and 38 from other causes. All 12 control dogs have died. Only one exposed dog still survives at 5661 days after inhalation exposure. 3 references, 2 figures, 2 tables.

37912 (LMF—115, pp 182-186) **Toxicity of $^{91}Y$ inhaled in a relative insoluble form by beagle dogs. XVII.** Hahn, F.F.; Muggenburg, B.A.; Hobbs, C.H.; McClellan. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Beagle dogs were exposed by inhalation to aerosols of $^{91}Y$ in fused aluminosilicate particles, resulting in initial lung burdens ranging from 11 to 360 μCi (0.4-13 MBq) $^{91}Y$/kg body weight. These 96 dogs plus 12 controls were maintained for life-span observation of toxic and carcinogenic effects. Dogs with the highest lung burdens died at early times with radiation pneumonitis. At later times, tumors were seen in lung, nasal cavity, heart, and tracheobronchial lymph nodes; these organs received the highest radiation doses. Observations are continuing on the 2 exposed dogs that remain alive 5624 and 5721 days after exposure. 2 figures, 1 table.

37913 (LMF—115, pp 187-192) **Toxicity of $^{144}$Ce inhaled in a relatively insoluble form by Beagle dogs XIX.** Boecker, B.B.; Hahn, F.F.; Muggenburg, B.A.; Gillett, N.A.; Mauderly, J.L.; McClellan, R.O.; Pickrell, J.A. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Beagle dogs are being studied over their entire life span after a single inhalation exposure to $^{144}$Ce in a relatively insoluble form. One hundred and eleven young adult Beagles were exposed once, briefly, to an aerosol of $^{144}$Ce in fused aluminosilicate particles, to achieve initial lung burdens ranging from 0.0024 to 210 μCi $^{144}$Ce/kg body weight (0.089-7800 kBq/kq), and 15 others were exposed to nonradioactive fused aluminosilicate particles. At the present time (at least 15 yr after exposure), 109 dogs that inhaled $^{144}$Ce and 15 control dogs have died or been euthanized. Observations are continuing on the remaining two $^{144}$Ce-exposed dogs. 5 references, 3 figures, 1 table.

37914 (LMF—115, pp 193-197) **Toxicity of $^{144}$Ce inhaled in a relatively insoluble from by immature Beagle dogs. XV.** Boecker, B.B.; Muggenburg, B.A.; Hahn, F.F.; Mauderly, J.L.; McClellan, R.O. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Immature Beagle dogs (3 mo old) received a single brief inhalation exposure to $^{144}$Ce in fused aluminosilicate particles to study the long-term biological effects of an inhaled beta emitter in a relatively insoluble form. Forty-nine dogs inhaled graded levels of $^{144}$Ce that resulted in initial lung burdens of $^{144}$Ce ranging from 0.004 to 140 μCi/kg (0.15 to 5200 kBq/kg) body weight. Five control dogs were exposed via inhalation to nonradioactive fused aluminosilicate particles. Thirty-three of the $^{144}$Ce-exposed dogs have died; eleven with lung tumors, four with tumors of the tracheobronchial lymph nodes and seven with non-neoplastic diseases of the respiratory tract. Sixteen $^{144}$Ce-exposed and two control dogs are still surviving. 2 figures, 1 table.

37915 (LMF—115, pp 198-203) **Toxicity of $^{90}$Sr inhaled in a relatively insoluble form by Beagle dogs. XV.** Snipes, M.B.; Hahn, F.F.; Muggenburg, B.A.; Mauderly, J.L.; McClellan, R.O.; Pickrell, J.A. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

This study was initiated to determine health effects resulting from inhalation of $^{90}$Sr in a relatively insoluble form. Beagle dogs were briefly exposed by inhalation to produce lung burdens of $^{90}$Sr that ranged from 0.12 to 96 μCi (4.4 to 3550 kBq)/kg body weight. High-level exposures caused radiation pneumonitis and pulmonary fibrosis resulting in deaths typically less than 500 days after exposure. Lower-level exposures are producing long-term health effects, including cancer of the lung, heart, and tracheobronchial lymph nodes. Most tumors have been hemangiosarcomas. During the last two years hemangiosarcomas of the tracheobronchial lymph nodes have been very prevalent. Three control dogs and five $^{90}$Sr-exposed dogs died or were euthanized during the past year. The remaining seven exposed and two control dogs are 12 years old and are being maintained for lifetime observation. 2 figures, 2 tables.

37916 (LMF—115, pp 204-207) **Biological effects of repeated inhalation exposure of Beagle dogs to relatively insoluble aerosols of $^{144}$Ce. XII.** Boecker, B.B.; Hahn, F.F.; Muggenburg, B.A.; McClellan, R.O.; Mauderly, J.L.; Pickrell, J.A. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Beagle dogs were exposed in different inhalation exposure regimens to a relatively insoluble form of $^{144}$Ce to study the biological effects of repeated inhalation exposures as compared with those from a single inhalation exposure. Four groups of 9 dogs each were exposed once every 8 wk for 2 yr (13 exposures). The exposures were conducted to (1) increase the lung burden by 2.5 μCi (93 kBq) 144Ce/kg body weight with each exposure, (2) re-establish lung burdens of 9.0 or 4.5 μCi (330 or 170 kBq) $^{144}$Ce/kg body weight, and (3) expose controls to the insoluble matrix containing nonradioactive Ce. Pulmonary carcinomas (10 dogs) and hemangiosarcomas in the tracheobrochial lymph nodes (5 dogs) were the most prevalent findings in the $^{144}$Ce-exposed dogs. All $^{144}$Ce-exposed dogs are now dead. Two control dogs died during the past year and observations are continuing on the two controls remaining alive at 12.8 yr after the first exposure. 2 tables.

37917 (LMF—115, pp 208-214) **Toxicity of inhaled alpha-emitting radionuclides - status report.** Muggenburg, B.A.; Mewhinney, J.A.; Guilmette, R.A.; Lundgren, D.L.; Hahn, F.F.; Boecker, B.B.; McClellan, R.O. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

The toxicity of inhaled alpha-emitting radionuclides is being investigated in a series of interrelated dose-response studies. Dogs, rodents, and nonhuman primates have been exposed to monodisperse or polydisperse aerosols of the oxides of $^{239}$Pu, $^{238}$Pu, $^{241}$Am, or $^{244}$Cm to measure the relative importance of average organ dose, local dose around particles, specific activity, chemical form, particle size, and number of particles inhaled to the development of biological effects. The influence of animal species, age at exposure, and pre-existing lung disease are also being studied because they may influence the toxicity of these radionuclides. 5 references, 3 figures, 2 tables.

37918 (LMF—115, pp 215-225) **Toxicity of inhaled $^{238}PuO_2$ in Beagle dogs: A. Monodisperse 1.5 μ AMAD particles. B. Monodisperse 3.0 μm particles. XIII.** Mewhinney, J.A.; Hahan, F.F.; Muggenburg, B.A.; Gillett, N.A.; Diel, J.H.; Mauderly, J.L.; Boecker, B.B.; McClellan, R.O. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Beagle dogs inhaled one of two sizes of monodisperse aerosols of $^{238}PuO_2$ that resulted in graded levels of $^{238}$Pu in the lung. All dogs are being studied for their life span. One-hundred and twenty-five dogs that had initial lung burdens ranging from 0.01 to 1.5 μCi $^{238}$Pu per kilogram body weight (0.37 to 56 kBq/kg) have died, eight with radiation pneumonitis and pulmonary fibrosis, 7 with lung tumors, 84 with bone tumors, 2 with liver tumors, and 24 of miscellaneous causes. Seven control dogs have died. Observations are being continued on 20 exposed and 17 control dogs alive at 3847-4675 days after exposure. 2 references, 7 figures, 1 table.

37919 (LMF—115, pp 226-232) **Toxicity of inhaled $^{239}PuO_2$ in Beagle dogs. A. Monodisperse 0.75 μm AMAD particles. B. Monodisperse 1.5 μm AMAD particles. C. Monodisperse 3.0 μm AMAD particles. IX.** Muggenburg, B.A.; Guilmette, R.A.; Hahn, F.F.; Boecker, B.B.; McClellan, R.O. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Beagle dogs were exposed monodisperse aerosols of $^{239}PuO_2$ of 0.75, 1.5, or 3.0 μm activity median aerodynamic diameter (AMAD) to obtain information on the relative importance of homogeneity of alpha irradiation doses to the lung. The dogs' initial lung burdens ranged from 0.0002 to 2.6 μCi (0.0074 to 96 kBq) $^{239}$Pu/kg of body weight. Thirty-six dogs exposed to the aerosol diluent are the controls. Twenty-eight of 48 exposed dogs have died to date in the study with 0.75 μm AMAD particles, 57 of 96 have died in the study with 1.5 μm AMAD particles, and 50 of 72 have died in the study with the 3.0 μm AMAD particles. Three control dogs of 36 have died. The dogs exposed to $^{239}$Pu that have died to date have died with radiation pneumonitis and fibrous and/or lung cancer. Surviving dogs have lived up to 3500 days after exposure. 6 figures, 1 table.

37920 (LMF—115, pp 233-238) **Toxicity of $^{239}PuO_2$ in immature Beagle dogs. VIII.** Guilmette, R.A.; Muggenburg, B.A.; Hahn, F.F.; Boecker, B.B.; McClellan, R.O. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Immature Beagle dogs have been exposed by inhalation to a monodisperse aerosol of $^{239}PuO_2$ (1.5 μm AMAD) to compare the biological effects with those observed in dogs exposed to a similar aerosol as young or aged adults. The study includes 96 dogs exposed to $^{239}PuO_2$ and 12 controls. The lung burdens of the plutonium-exposed dogs ranged from 0.00030 to 0.80 μCi/kg body weight (0.011-30 kBq/kg). A total of 82 experimental and 11 control dogs are still alive. Seven dogs died this year. Of these, six died of radiation-induced lung disease; the other of a nonradiation cause. As is the case for dogs exposed as young adult animals, the primary causes of death have been lung carcinomas and radiation pneumonitis and fibrosis. However, it is premature to compare the dose-response relationships for the two age groups. 4 figures.

37921 (LMF—115, pp 239-242) **Toxicity of $^{239}PuO_2$ inhaled by aged Beagle dogs. VIII.** Muggenburg, B.A.; Hahn, F.F.; Gillett, N.A.; Guilmette, R.A.; Boecker, B.B.; McClellan, R.O. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

The effects of age at exposure on the metabolism, dosimetry, and biological effects of inhaled particles of $^{239}PuO_2$ are being studied in aged Beagle dogs (8.0 to 10.5 yr of age at exposure). Forty-eight dogs inhaled $^{238}PuO_2$ particles with an activity median aerodynamic diameter of 1.5 μm to achieve initial lung burdens ranging from 0.02 to 0.66 μCi $^{239}Pu$/kg body weight (0.75 to 24 kBq/kg). Twelve other dos were exposed to the aerosol diluent only. Forty-four exposed dogs have died, including one in the past year, and nine control dogs have died, including on in the past year, through 1566 to 2727 days after exposure. Radiation pneumonitis and fibrosis have been the primary causes of death in these aged dogs exposed to $^{239}PuO_2$. Four $^{239}PuO_2$ exposed dogs and three control dogs are still surviving.

37922 (LMF—115, pp 243-246) **Repeated inhalation exposure of Beagle dogs to aerosols of $^{239}PuO_2$. X.** Diel, J.H.; Hahn, F.F.; Muggenburg, B.A. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Beagle dogs were exposed once or repeatedly by inhalation to aerosols of $^{239}PuO_2$ to study the relative doses and effects of these two types of exposures. Dogs exposed at high levels died predominantly of radiation pneumonitis and pulmonary fibrosis. Dogs exposed at lower levels, either once or repeatedly, are dying of a variety of causes including lung cancer. Sixty dogs have survived up to 9 years after their first exposure with a total of 18 actual or sham exposures. 2 references, 2 figures, 1 table.

37923 (LMF—115, pp 247-250) **Late-occurring nonstochastic effects from internal-emitting radionuclides - results from studies in animals.** Hahn, F.F.; Muggenburg, B.A.; Boecker, B.B.; McClellan, R.O. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Nonstochastic or nontumor effects of irradiation are generally considered to be the results of high radiation doses that occur at early times after exposure. Two situations from long-term studies of dogs that inhaled beta-emitting radionuclides are illustrated to show that nonstochastic effects can occur at long times after exposure and at relatively low doses, those where radiation-induced tumors are expected. Dogs that inhaled $^{144}CeCl_3$ and received radiation doses to the liver developed hepatocellular necrosis and degeneration that was severe enough to cause death in some dogs. Dogs that inhaled $^{144}Ce$ FAP developed a greater number of tumors in nonirradiated tissue than did the controls perhaps through an effect on the immune system. Neither of these possibilities is considered in current approaches to risk estimation for internally deposited radionuclides. 3 references, 3 figures.

37924 (LMF—115, pp 251-256) **Cardiopulmonary function of dogs with plutonium-induced chronic lung injury.** Muggenburg, B.A.; Wolff, R.K.; Mauderly, J.L.; Plaggmier, M.M.; Gerlach, R.F. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Twenty dogs exposed by inhalation in the study, Toxicity of Inhaled $^{239}PuO_2$ in Beagle Dogs, were evaluated for cardiopulmonary function. Another group of 10 dogs matched by age and sex, but not exposed to $^{239}Pu$, was also given the same cardiopulmonary function tests. The plutonium-exposed dogs were 7 or more years after exposure and ten of the dogs had clinical signs and pulmonary function values indicating radiation pneumonitis-pulmonary fibrosis. The occurrence of radiation pneumonitis-pulmonary fibrosis, a nonstochastic effect, over the same time period and range of lung doses as lung cancer, a stochastic effect, complicates the estimation of lung cancer risk for inhaled plutonium. 4 references, 4 figures, 2 tables.

37925 (LMF—115, pp 257-262) **Effects of relatively low-level exposure of rats to inhaled $^{144}CeO_2$. II.** Lundgren, D.L.; Hahn, F.F.; Griffith, W.C.; Cuddihy, R.G.; Boecker, B.B. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

A study was initiated to determine the risk of lung cancer in rats exposed to relatively low doses from an inhaled beta-emitting radionuclide, $^{144}Ce$. These data will be used in a matrix of dose-response data from several species to estimate the risk of lung cancer in people exposed by inhalation to beta-emitting radionuclides. Of the 2860 rats entered into this study, 465 died during the past year. There were no consistent relationships between the initial lung burdens (ILB) of $^{144}Ce$ and subsequent survival of the rats. Preliminary data indicate that 83% of the ILB was cleared with a half-time of 20 days and 17% cleared with a half-time of 125 days. 7 references, 1 figure, 2 tables.

37926 (LMF—115, pp 263-266) **Toxic effects of inhaled $^{244}Cm_2O_3$ in rats. IV.** Lundgren, D.L.; Hahn, F.F.; Guilmette, R.A.; Gillett, N.A. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

The toxicity of $^{244}Cm$ is being studied in rats that inhaled monodisperse aerosols of $^{244}Cm_2O_3$ at levels ranging from 1 to 17,000 nCi/kg body weight. Analysis of the retention and dosimetry of $^{244}Cm$ in lung, liver, and skeleton has been completed. Total alpha doses to the lung ranged from 21 +/- 6 rad (0.21 +/- 0.06 Gy) in the lowest group to 6200 +/- 1600 rad (62 +/- 16 Gy) in the highest dose group. Comparable doses to skeleton were 1.5 +/- 0.5 rad (0.015 +/- 0.005 Gy) to 150 +/- 63 rad (1.5 +/- 0.63 Gy) and to liver were 0.03 +/- 0.04 rad (0.0003 +/- 0.0004 Gy) to 7.1 +/- 2.8 rad (0.071 +/- 0.028 Gy). 5 references, 4 tables.

37927 (LMF—115, pp 267-269) **Influence of heterogeneous alpha irradiation of Chinese hamster liver on the induction of cancer. II.** Guilmette, R.A.; Gillett, N.A.; Brooks, A.L.; Hahn, F.F.; Eidson, A.F. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

To investigate the influence of heterogeneity of alpha-radiation dose on the induction of liver cancer, Chinese hamsters were injected intravenously with colloidal thorium dioxide particles (Thorotrast) and are being maintained for life span observations. The biological effects seen as a result of a Thorotrast injections are being compared with results obtained in other hamsters that were injected intravenously with $^{239}Pu$-citrate. As of 9-30-86, 80% of the animals receiving the highest dose of Thorotrast, 200 pCi (7.4 Bq) per gram body mass), 25% of the group receiving 40 pCi Thorotrast (1.5 Bq) per gram, and 22% of the group receiving 8 pCi Thorotrast (0.3 Bq) per gram had died. This compared with a 24% mortality for the animals injected with 200 pCi $^{239}Pu$-citrate (7.4 Bq) per gram and 16 to 18% in control animals. It is premature to draw any inferences relative to the effect of α-radiation dose pattern on the induction of liver cancer in these animals. 1 table.

37928 (LMF—115, pp 306-312) **Interaction of radiation and carcinogens in the production of mutations.** Brooks, A.L.; Seiler, F.A. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Studies were conducted to determine if synergistic interactions occur between radiation exposure and carcinogenic chemical treatment when given in combination. The frequency of radiation and chemically induced mutations and cell killing was determined CHO cells. The cells were exposed to 500 rad of X-rays or a single concentration of N-methyl-N'-nitro-N-nitrosoguanidine, benzo(a)pyrene, 3-methylcholanthrene, dibenzo(c,g)carbazole, alone, or in combination. For each combination of X rays and a chemical, the observed mutagenic response was less than predicted by an additive model. The mutation frequency was also measured for graded doses of 3-methylcholanthrene and X-ray exposures given alone and in combination. The data were fitted to a surface described as mutation frequency = $4.9 \times 10^{-5} D^2 + 142 C^2 - 2.1 \times 10^{-4} D^2C^2$ where D is dose in rads and C is concentration of chemical in ug/ml. The negative interactive term indicates that over the dose range studied there was an antagonistic interaction between radiation and chemicals in production of mutations. 3 references, 3 figures.

37929 (LMF—115, pp 346-349) **Effect of irradiation on unscheduled DNA synthesis induced by 4-nitroquinoline in tracheal epithelium of rats.** Hahn, F.F.; Kennedy, R.; Brooks, A.L. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Unscheduled DNA synthesis (UDS) was determined in rat epithelium by autoradiographic techniques to determine the influence of prior irradiation on the ability of the cells to repair mutagenic damage induced by 4-nitroquionoline (4NQO). UDS was stimulated by in vitro exposure to 4NPO. However, prior whole-body irradiation of rats with either 50 or 300 rad did not alter the UDS induced by 4NQO. The results of this study do not support the hypothesis that irradiation can induce DNA repair enzymes in respiratory tract epithelium. 5 references, 3 figures.

37930 (LMF—115, pp 394-396) **Preventing the translocation of inhaled $^{241}Am$ in dogs using continuously infused DTPA.** Guilmette, R.A.; Muggenburg, B.A. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

The objective of this study was to reduce the translocation of $^{241}Am$ from lung to liver and bone in dogs that inhaled a moderately soluble aerosol of $^{241}AmO_2$. To accomplish this, two dogs that inhaled a polydisperse aerosol of $^{241}Amo_2$ received a subcutaneous implantation of a set of osmotic pumps containing the chelating agent diethylenetriaminepentacetic acid (DTPA). These pumps ensured that DTPA was present in the circulation at all times during the 64-day duration of the experiment. To compare the efficacy of this treatment, another pair of dogs that inhaled $^{241}AmO_2$ received DTPA by discrete intravenous injections. A third pair of exposed dogs served as a control group and received saline injections. Although results to date are preliminary, it appears that the use of continuously infused DTPA was significantly more effective than the injected DTPA treatment in reducing the translocation of solubilized Am from lung to the liver and skeleton. Future results will provide better quantification of the effectiveness of the continuous-infusion therapy approach. 1 reference, 1 table.

37931 (NUREG/CR—4653) **GASPAR II: Technical reference and user guide.** Strenge, D.L.; Bander, T.J.; Soldat, J.K. (Pacific Northwest Lab., Richland, WA (USA); Nuclear Regulatory Commission, Washington, DC (USA). Div. of Safety Review and Oversight). Mar 1987. Contract AC06-76RL01830. 311p. (PNL—5907). NTIS, PC E12/MF A01 - GPO. File Number TI87011019.

This report describes the computer program GASPAR II used by the staff of the US Nuclear Regulatory Commission to perform environmental dose analyses for releases of radioactive effluents from nuclear power plants into the atmosphere. The analyses estimate radiation dose to individuals and population groups from inhalation, ingestion (terrestrial foods), and external-exposure (ground and plume) pathways. The calculated doses provide information for National Environmental Policy Act (NEPA) evaluations and for determining compliance with Appendix I of 10 CFR 50 (the "ALARA" philosophy). The report also instructs the user in preparing input to the program, describes the mathematical models that are used, and supplies detailed information on program structure and parameters used to modify the program. 20 refs., 11 figs., 77 tabs.

37932 (PNL-SA—14190) **Microdosimetric basis for exposure limits.** Brackenbush, L.W.; Braby, L.A. (Pacific Northwest Lab., Richland, WA (USA)). Oct 1986. Contract AC06-76RL01830. 19p. (CONF-861044—8). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011156.

From Hanford Life Sciences symposium: radiation protection-a look to the future - celebrating four decades of research at Hanford; Richland, WA, USA (21 Oct 1986).

The new organ-weighted effective dose equivalents should provide a much more accurate estimation of the degree of hazard for a worker's exposure to ionizing radiations. The method involves the microdosimetric concept of lineal energy to help establish exposure limits and will provide a unified system applicable to all types of ionizing radiation. Rather than being only calculated values, the effective dose equivalents and quality factors will be experimentally measured using tissue equivalent proportional counters. The measurement may be difficult to perform at various depths in an anthropomorphic phantom. Operational health physicists will be concerned about the lack of survey instruments and personnel dosimeters that measure lineal energy distributions. Their possible objections may be mitigated by the commercial introduction of instruments based upon tissue equivalent proportional counters or related devices containing inexpensive microprocessors. The many potential benefits include providing a uniform method for implementing the proposed increases in quality factors for neutrons and photons, providing a more unified approach for combining external and internal exposures, and potentially resolving questions about dosimeter placement and dose assessment for nonuniform exposures to mixed radiations. 16 refs., 3 figs.

From Taiwan Power Company conference; Taipei, Taiwan (17 Jun 1987).

This document provides a topical outline with projected diagrams from an oral presentation given to the Taiwan Power Company conference in Taipei, Taiwan. The author describes medical, toxic compound, epidemiological, and industrial hygiene records maintained in the occupational review programs on a VAX 11/750 computer. He also lists the data bases and their component segments, physical examination criteria, health physics topics, and report formats that are used with the system. 7 figs.

37934 **The multicellular nature of radiation carcinogenesis.** Rossi, H.H.; Hall, E.J. (Dept. of Radiology, Columbia Univ., College of Physicians and Surgeons, New York, NY 10032). pp 359-368 of Radiation carcinogenesis: Epidemiology and biological significance. Boice, J.D.; Fraumeni, J.F. New York, NY; Raven Press (1984).

The authors propose that the commitment to transformation is made soon after irradiation - at least before the 7th day - and not after confluence as hypothesized by a previous study. Also, the number of foci per dish when cells are reseeded 1, 2, and 3 weeks after irradiation does not increase as rapidly as one would expect in view of the early commitment to the transformed state. This suggests a strong suppression of the expression of transformation.

37935 **Radium-dial workers.** Rowland, R.E.; Lucas, H.F. (Center for Human Radiobiology, Argonne National Lab., Argonne, IL 60439). pp 231-240 of Radiation carcinogenesis: Epidemiology and biological significance. Boice, J.D.; Fraumeni, J.F. New York, NY; Raven Press (1984). Contract W-31-109-ENG-38.

The population of radium-dial workers, which has now been studied for more than half a century, constitutes a resource of considerable value. More than 1,100 workers who were exposed to radium 30 to 50 years ago are currently being followed by the Center for Human Radiobiology at the Argonne National Laboratory. It is not clear that radium has induced additional malignancies in this population, other than the well-known bone sarcomas and head carcinomas, but elevated incidence rates for multiple myeloma and cancers of the colon, rectum, stomach, and breast suggest that radium might be involved. Continued follow-up of this population may resolve these questions.

## 5602 Thermal Effects

37936 **(CONF-8704145—1) Stopping biological time: The freezing of living cells.** Mazur, P. (Oak Ridge National Lab., TN (USA)). 1987. Contract AC05-84OR21400. 36p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87010898.

From 5. world congress on in vitro fertilization and embryo transfer; Norfolk, VA, USA (8 Apr 1987).

The fundamental physical-chemical events that occur during the freezing and thawing of cells are outlined and the manner in which cell permeability determines the response of the cell to freezing is discussed both in terms of physical response and in terms of survival. 40 refs., 12 figs.

37937 **(BNL—39866) Effects of calmodulin inhibitors on the cellular metabolism of $^{45}Ca$ and $^{210}Pb$.** Pounds, J.G.; Nye, A.C. (Brookhaven National Lab., Upton, NY (USA)). 1987. Contract AC02-76CH00016. 3p. (CONF-8705124—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010790.

From TEMA-6: 6th international conference on trace elements in man and animals; Asilomar, CA, USA (31 May 1987).

Altered $Ca^{++}$ homeostasis may result from the direct inhibition of calmodulin-dependent or -independent transport processes. Changes in cell function not directly related to the transport of Ca, e.g., uncoupling of oxidative phosphorylation or altered membrane permeability also disrupt cell calcium metabolism. Thus, the effects of the calmodulin inhibitor W-13 on cell $Pb^{++}$ metabolism may be due to its direct effects on $Pb^{++}$ transporting $Ca^{++}$ pumps, or indirectly as a result of changes in $Ca^{++}$ homeostasis. Direct comparison of the effects of W-13 on the metabolism of Pb and Ca is impaired by differences in the kinetic distribution and behavior of Pb and Ca. A further complication is that the calmodulin-dependent processes are most active during periods of elevated intracellular $Ca^{++}$. The preliminary experiments reported here were conducted in unstimulated cells which have a low resting level of cytosolic $Ca^{++}$. Therefore, W-13 induced alterations in cell $Ca^{++}$ and $Pb^{++}$ may not reflect the changes which could occur in stimulated cells. 1 ref., 1 fig.

37938 (CONF-8508235—, pp 63-69) **Monitoring the modifications in the forest ecosystem of the Brazilian Amazon region through remote sensing techniques.** Carneiro, C.M.R. (Ministry of Agriculture, Brasilia, Brazil. Brazilian Inst. for Forestry Development). 1985. NTIS (US Sales Only), PC A16/MF A01. File Number DE87752457.

From IUFRO conference on inventoring and monitoring endangered forests; Zurich, Switzerland (19 Aug 1985).

This paper describes the most important forest ecosystem of Brazil - the Amazon forest, its characteristics and main agents of spatial modifications and changes. It mainly explains how these modifications are being annually monitored through the Brazilian Forest Cover Monitoring Program of the Brazilian Institute for Forestry Development - IBDF - the forest service of Brazil.

37939 (CONF-8508235—, pp 223-228) **Thinning out of the tree crown - what is hidden in that integrated measure of forest damage.** Westman, L.; Lesinski, J. (Umeaa Univ., Sweden. Inst. of Ecological Botany; Agricultural Univ., Krakow, Poland. Forest Faculty). 1985. NTIS (US Sales Only), PC A16/MF A01. File Number DE87752457.

From IUFRO conference on inventoring and monitoring endangered forests; Zurich, Switzerland (19 Aug 1985).

Thinning out of the crown is an easily observable measure for evaluation of tree vitality. For this reason it is extensively utilized for inventories in damaged spruce tree stands. However, the phenomenon involves a complex of differentiated symptoms of injury. The thinning out of a spruce crown under the influence of abiotic and biotic factors is a normal phenomenon closely connected to gradual aging. However, particular trees of the same age may show various stages of thinning out. Normal thinning out involves loss of the oldest needles and eventually drying and loss of the oldest lateral shoots. When the forest ecosystem homeostasis is imbalanced, for example, under the direct or indirect influence of air pollutants, the thinning out may develop more rapidly and begin even in the youngest parts of an individual branch. Particular kinds of lateral shoots play different roles during the process of thinning out. Thus the number and contribution in the living biomass of ordinary, adventitious and secondary shoots vary lengthwise along the branch as well as vertically within the crown. The interaction between branch destruction and secondary shoot development is presented to illustrate the complexity of the measure being discussed.

37940 (CONF-8508235—, pp 269-271) **Special inventories to record the state of health of forest in Hungary and its improvement.** Solymos, R. (Ministry of Agriculture and Nutrition, Budapest, Hungary). 1985. (In German). NTIS (US Sales Only), PC A16/MF A01. File Number DE87752457.

From IUFRO conference on inventoring and monitoring endangered forests; Zurich, Switzerland (19 Aug 1985).

In Hungary several organisations are in charge of controlling and surveying the state of health of forests in coordination by the forestry inspection authorities. When a forest management facility is set up, the different harmful insects and adverse effects are pinpointed and recorded per forest plot. The investigation areas arranged in a grid of 4 x 4 kilometres mesh width provide a long-term inventory grid. They are completed by case-to-case surveys in the event of unexpected incidence of harmful insects. In the whole country, light traps are in operation to predict insect pest. In every region, research stations for forest protection and ecology are being set up or extended covering a whole range of ecological factors from the soil to air pollutants. Relations between wood increment and environmental effects are investigated at the level of nationwide areas for long-term study of timber yield. Data are stored by a central data bank which is at the disposal of forestry enterprises and the supreme national authority.

37941 (CONF-8508235—, pp 333-338) **Mathematical and statistical evaluations of needle analyses.** Becher, G. (Bundesforschungsanstalt fuer Forst- und Holzwirtschaft, Hamburg, Germany, F.R. Inst. fuer Weltforstwirtschaft). 1985. (In German). NTIS (US Sales Only), PC A16/MF A01. File Number DE87752457.

From IUFRO conference on inventoring and monitoring endangered forests; Zurich, Switzerland (19 Aug 1985).

The contents of p-elements in one year old Norway spruce needles are considered as observations from a multivariate normally distributed random vector. To assess the quantitative differences in element contents of the needles between different sites, the linear discriminant analysis is proposed, mathematically derived and discussed. Apart from the problem of describing the complicated correlation structures of element contents, there are difficulties in interpreting and reducing parameters describing them. Using the exponential family of normal distributions for parameter representation the covariance selection as a procedure for analysis of correlation structure is discussed.

37942 (CONF-8608141—, pp 59-69) **Increasing net primary productivity in Washington (USA) forests during the last 100 years.** Graumlich, L.J.; Brubaker, L.B. (Univ. of California, Los Angeles). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Evidence of 20th-century increases in atmospheric $CO_2$ and global temperatures has prompted interest in the effects of these factors on the productivity of terrestrial vegetation and in the role of vegetation in sequestering atmospheric $CO_2$. The authors compare the temporal course of net primary productivity of forest stands in western Washington with records of $CO_2$ and climate. Annual estimates of net primary productivity extending back to 1880 indicate that productivity has increased 60% during the 20th century. Annual production is significantly correlated with long-term variation in summer temperature and short-term variation in annual precipitation. Production is uncorrelated with atmospheric $CO_2$ concentrations, suggesting that direct $CO_2$ fertilization is currently unimportant in these forests. 15 references, 3 figures, 1 table.

37943 (CONF-8608141—, pp 353-359) **Southern forest growth trends: air pollution influence studies and tree-ring analysis.** Dell, T.R. (Dept. of Agriculture). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Allegations of decline in forest health related to atmospheric pollution in the southern US have prompted new research programs. This is a summary of the opportunities and motivation for research on atmospheric pollution influences of the commercial forest production of the southern US. The overview will be limited to retrospective field studies, with trees in a forest setting rather than the more controlled dose-response circumstance in various types of growth chambers. For studies involving trees grown in a natural state, forest growth and yield methods and data bases are likely to play a significant role. Furthermore, this is the category where tree-ring analysis is being employed, and there are opportunities for combining approaches from the two disciplines. Hopefully the controlled condition studies and processes of extrapolating results to actual forests will evolve and be linked with sets of plots designed for future monitoring. However, at the present time, data taken from past studies or tree-rings must be utilized to provide initial guidance. 7 references, 1 figure, 1 table.

37944 (CONF-8608141—, pp 372-381) **Growth-rate trends of pines since 1930 in the northeastern United States.** Whiton, J.C. (Geological Survey). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Long-term radial growth rates of white, pitch, and shortleaf pines in the northeastern United States were calculated and examined for evidence of growth trends that are coincident with changing atmospheric pollution levels in the last half-century. Growth rates were determined in terms of changes in annual ring area. Growth rings of more than 800 trees in thirteen states were analyzed. White pine shows the greatest growth rates, pitch pine the lowest. Pitch pine sampled on two sites near a rayon-producing factory in Virginia show severe decline less than ten years after the factory began operating in 1939. These pitch pine collections showed much lower growth rates since 1950 than any other collection of trees. Some pitch pine and shortleaf pine collections had negative growth rates at some time between 1930 and 1980, unlike white pine. Most of these reduced growth rates were after 1985. Changes in growth trends are neither synchronous nor parallel for pines throughout the northeast, nor does any clear pattern of decline exist within regions of the northeast. Growth trends are probably most reflective of climatic trends. 13 references, 5 figures.

37945 (CONF-8608141—, pp 392-400) **Tolerance and susceptibility to air pollution, a new direction in sampling strategy: a case study of Pinus strobus L. in Acadia National Park, Maine.** Treshow, M.; Sutherland, E.K.; Bennett, J.P. Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

In this study, the authors use an alternate sampling strategy to assess the effects of a region-scale air pollution on tree growth, before visible injury symptoms have appeared. Genetic variability in susceptibility to pollutants such as ozone has long been described in herbaceous and woody plants. If a stand of trees at a site can be stratified into groups of trees relatively tolerant and susceptible to an air pollutant, then the tolerant trees may be used as a control group to compare to the stressed group. The limitation of this method is of course that the tolerant trees are still incurring some damage, and the assessment of air pollution effects will be conservative. However, the problem of comparison of site separated by distance is entirely eliminated, and analytic methods to compare growth of the two groups may be quite simple. The authors case study examines the effect of ozone on the radial growth of eastern white pine (Pinus strobus L.) trees in Acadia National Park, Maine, stratified into two groups of sensitivity based on foliar symptoms. 27 references, 1 figure.

37946 (CONF-8608141—, pp 402-409) **Detecting the effects of ozone pollution of growth of Jeffrey pine in the Sierra Nevada, California.** Peterson, D.L.; Wakefield, V.A.; Arbaugh, M.J. (Dept. of Agriculture, Riverside, CA). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Jeffrey pine growth at sites with symptoms of ozone injury was compared to growth at sites without ozone injury at Sequoia and Kings Canyon National Parks, California. Growth index was 11% less in exposed trees than controls since 1965. Trees $>40$ cm diameter and $>100$ years old had larger growth reductions than smaller and younger trees. Regression analysis indicated that winter precipitation accounted for a large proportion of a variance in the growth of all trees. Ozone-stressed trees were more sensitive to variation in precipitation and temperature during recent years. These results are the first evidence of forest growth reduction associated with ozone injury in western North America outside the Los Angeles Basin. 12 references, 3 figures, 1 table.

37947 (CONF-8608141—, pp 410-416) **Dendroecological analysis of ambient sulfur dioxide effects in western larch.** Kincaid, W.B. (Arizona State Univ., Tempe). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Dendroecological methods were used to determine the responses in radial growth of western larch (Larix occidentalis Nutt.) to ambient $SO_2$ exposure. A unique, 32-year long record of ambient $SO_2$ concentrations was exploited to estimate annual $SO_2$ dose with a 0.25 ppm threshold. Tree-ring data were a subset from a previous study including three control sites and one polluted site, which was downriver from the monitor location, but close enough that exposure estimates were reasonable. An autoregression model was employed in a stagewise procedure that first removed climate effects by autoregression on the average of the controls and then estimated a dose-response relationship by autoregression of the residuals from the first stage on $SO_2$ exposure. Significant growth losses from air pollution were demonstrated that were approximately equal in magnitude to the variation explained by annual fluctuations of climate. 7 references, 3 figures.

37948 (CONF-8608141—, pp 451) **Potential physiological and ecological effects of increasing $CO_2$ on forests.** Strain, B.R. (Duke Univ., Durham, NC). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Atmospheric $CO_2$ is increasing and a concensus has emerged that global greenhouse warming is underway. Carbon dioxide induced climate change will undoubtedly affect the productivity and distribution of forests. The direct biological effects of $CO_2$ increase, however, are uncertain. Basically, $CO_2$ is a plant fertilizer. Photosynthesis, plant growth and development rate, growth form, nutritional status of plant tissues, and tolerance to environmental stress have all been shown to be affected by increase in atmospheric $CO_2$

concentration. Differential species responses to a given level of $CO_2$ increase, however, make it impossible to predict how multiple species ecosystems like forests will respond to $CO_2$ increase. In addition to uncertainties associated with ecological complexity, little physiological information exists for trees grown for long periods of time under $CO_2$ enrichment. Thus, the authors do not known how short term responses observed in most $CO_2$ experiments will be accumulated and integrated through time in perennial forest ecosystems. This paper will enumerate known plant and ecosystem responses to long-term $CO_2$ enrichment and will speculate on forest tree and forest ecosystem responses expected in coming decades.

37949 (CONF-8608141—, pp 452-462) **Radiodensitometric tree-ring along altitudinal gradients: some alternative procedures for detecting site, climatic, and potential $CO_2$ effects on tree growth.** Kienast, F. (Oak Ridge National Lab., TN). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045. Contract AC05-84OR21400.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Relationships among weather conditions, site elevations, site characteristics, and ring formation on trees growing along altitudinal transects were investigated. Thirty-four chronologies from four different climatic regions with a wide range of site conditions were analyzed with radiodensitometric methods. A graphical technique of data representation was developed to analyze the tree-ring pattern on a single-year basis. Typical examples are presented and the dynamics of the overlapping environmental influences are discussed. The broad spectrum of site conditions was used to identify ring parameters and site types most suitable for reconstruction of temperature or precipitation records. Additionally, the transects served as an ideal data base to test the theory of a possible growth enhancement caused by increased atmospheric carbon dioxide. Results show a growth increase (mainly in the ring widths) in about 25% of all chronologies during the last three decades. In most of the cases the increase is related to a specific site type, influenced only slightly by climatic stress. Sensitive chronologies with heavy climatic stress and complacent series did not show the increase. However, more favorable climatic conditions were found to coincide with this increase in more than 60% of all the chronologies that showed increased growth. Higher $CO_2$ levels could have contributed to an increase in 10 to 15%, at the most, of the 34 chronologies. 20 references, 2 figures, 1 table.

37950 (CONF-8608141—, pp 463-474) **Network of high elevation conifers in the western US for detection of tree-ring growth response to increasing atmospheric carbon dioxide.** Graybill, D.A. (Univ. of Arizona, Tucson). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

It is well documented that many agricultural crops and woody plants exhibit enhanced yield or growth when subjected to increased $CO_2$ concentrations under controlled conditions. Given the increase in atmospheric $CO_2$ since the mid 19th century there are a considerable number of questions about the timing, locations and nature of native plant growth response that might occur under ambient conditions. Long tree-ring series that are climatically sensitive and that may also contain a $CO_2$ growth response provide one basis for consideration of those questions. Ongoing research designed to develop a network of tree-ring chronologies in the western US that can be used to examine tree-ring growth response to changing $CO_2$ and climatic parameters is summarized. Current sampling is designed to cover most of the Great Basin and the Southwestern US, focusing on long-lived species growing under stressful climatic conditions and at elevations where a $CO_2$ signal might be most apparent. 19 references, 3 figures.

37951 (CONF-8608141—, pp 494-500) **Densitometric and ring width analysis of 3-year-old Pinus taeda L. and Liquidambar styraciflua L.; grown under three levels of $CO_2$ and two water regimes.** Telewski, F.W.; Strain, B.R. (Univ. of Arizona, Tucson). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Trees of Pinus taeda and Liquidambar styraciflua were grown from seed and treated for three years at 350, 500 and 650 ppm $CO_2$. Water stress was applied to one half of the plants in years 2 and 3. The twelve treatment groups were harvested and measurements were made to total stem diameter, ring width and wood density. In all treatment groups, increased $CO_2$ increased stem diameter. Individual ring widths also increased with increase in $CO_2$, the trend being clearer in Liquidambar styraciflua. There is no change in latewood density of L. styraciflua with $CO_2$ treatment. There was an apparent increase in latewood density in water stressed saplings compared with non-stressed saplings which is independent of $CO_2$ treatment. An apparent increase in latewood density was observed in P. taeda, especially in the last growth ring. Because of the great increase in individual ring widths in L. styraciflua the total ring biomass (integral density) increases with $CO_2$ treatment in well watered trees but decreases with drought. A similar trend was observed in the intergral density in P. taeda. No significant changes were observed in average density between any treatment group for either species. It is suggested that, at least for 3 year old saplings, ring width and integral density are more sensitive indicators of increased $CO_2$ under both drought and non-drought conditions than latewood maximum density or average ring density. 8 references, 5 tables.

37952 (CONF-8608141—, pp 501-510) **Seedling response to $CO_2$ enrichment under stressed and non-stressed conditions.** Doyle, T.W. (Oak Ridge National Lab., TN). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045. Contract AC05-84OR21400.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Loblolly pine and sweetgum seedlings were obtained from a Duke University phytotron study, where three groups were grown in different atmospheres of $CO_2$ (i.e., 350, 500, 650 ppmv). Seedlings were grown over three growing seasons, and included a set of water-stressed and non-stressed individuals. X-ray densitometry was used to evaluate growth and density characteristics of the wood samples. Cross-sectional discs of these samples were radiographed and scanned with a microdensitometer to determine ring width, area, density and mass for each growth year. Results indicated significant differences in wood production (ring width, area and mass) between the lowest treatment of $CO_2$ (350 ppmv) and the higher concentration (500 and 650 ppmv) treatments. While only a few density parameters demonstrated significant changes with increasing $CO_2$, almost all showed a systematic increase in density with increasing $CO_2$ concentration. Ring area and mass displayed the greatest degree of change between treatments. Induced drought effects appeared only to strengthen the $CO_2$-growth association. These findings suggest that naturally stressed trees are also likely to exhibit some growth effect with increasing atmospheric $CO_2$. And because the greatest margin of response existed between 350 and 500 ppmv, this study emphasizes the importance and need to determine growth responses at preindustrial era $CO_2$ concentrations in order to more accurately identify the postulated fertilizer effect on modern forests. 10 references, 4 tables.

37953 (CONF-8608141—, pp 511-521) **Recent abnormal increase in tree-ring widths: a possible effect of elevated atmospheric carbon dioxide.** Parker, M.L. (M.L. Parker Co., Inc., Vancouver, British Columbia). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Atmospheric $CO_2$ has increased from a preindustrial level of from 250 to 290 parts per million to a current level of about 345 ppm. It is expected to double at some time in the 21st century. Increased levels of $CO_2$ have been shown to increase tree growth under controlled conditions. Some forest trees may respond to increased $CO_2$ with increases in ring width, but this effect may be obscured by other environmental influences at some sites. Ring width values of Douglas-fir trees from a moist British Columbia site show a marked increase during the past few decades. Environmental influences other than increased $CO_2$ have not been found that would explain this. Pronounced growth increase during the last few decades is not present for Douglas-fir from the dry British Columbia interior. Raw ring width values were examined for the individ-

ual radii of trees from 17 sites in Canada and the northwest US. For the period after 1920, 7 sites show greater ring-width growth than would be expected if age were the only factor influencing growth. There is enough evidence to conclude that increased atmospheric $CO_2$ as well as other environmental factors, can affect forest growth. The authors should now determine the extent of that effect. 18 references, 7 figures, 3 tables.

37954 (CONF-8608141—, pp 579-590) **Time-dependent responses of trees to weather variations an application of the Kalman filter.** Visser, H.; Molenaar, J. Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

To find effects of air pollution in ring-width series it is important to filter out the influence of the weather. In this paper the method of response functions is made more flexible by application of the Kalman filter technique. The filter allows for changes in the response of trees to weather variations over time. The Kalman filter is described in short, and applied to simulated as well as real ring-width series. It is suggested that time-dependency of response functions could be an air pollution phenomenon. 22 references, 6 figures.

37955 (CONF-8608141—, pp 591-598) **Tree-growth, ARMA modelling and pollution.** Serre-Bachet, F. (Universite Aix-Marseille III, France). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

The slopes of the Arc-Mauriene Valley in France have been exposed to an increasing fluoride pollution since the beginning of the century. This diameter growth of four coniferous species in analyzed here. Preliminary results on spruce (Picea excelsa Link) show a parallelism between sensitivity to climate and pollution. The ARMA modelling procedure has been used to evidence relationships between tree rings and climate. 30 references, 3 figures, 2 tables.

37956 (CONF-8608141—, pp 690-698) **History of the chemical environment from elemental analysis of tree rings.** McClenahen, J.R.; Vimmerstedt, J.P.; Lathrop, R.C. (Ohio State Univ., Columbus). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Studies are underway to assess the feasibility of reconstructing historical changes in the chemical environment of forests, specifically in relation to airborne pollutant deposition, from time series of elemental concentrations in annual rings of trees. Objectives pertinent to this report were: (1) To assess the statistical variability of element profiles within annual rings and within and among trees on a site and, (2) To determine the effect of changing soil chemistry on element concentrations in annual rings. Additional studies will address the potential for lateral element transport, effects of soil type, ring width, and climate on xylem element concentrations, and the sensitivity of element concentrations to different pollutant deposition gradients. 2 figures, 2 tables.

37957 (CONF-8611165—1) **Feasibility of field detection and analysis of the toxic products of combustion.** Zaromb, S.; Buttner, W.J.; Stamoudis, V.C.; Domin, D.; Privette, J. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 5p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87011353.

From Annual conference on fire research; Gaithersburg, MD, USA (3 Nov 1986).

This work evaluates the applicability of chemical parameter spectrometry (CPS) and allied techniques to the design and construction of an instrument for the detection and analysis of the toxic products of combustion. The capability sought in the near term is field detection and selective quantitation of at least five toxic compounds of primary interest in the presence of other combustion products. Ultimately, the instrument will provide analyses of all or most of the toxic products formed during combustion that present a danger to human health. CPS consists of measuring a number of different chemical parameters obtained from sensor responses to a given analyte and thus developing a characteristic response pattern or parameter spectrum. A comparison of that spectrum with previously determined parameter spectra for a variety of compounds may then permit identification of an unknown compound in the analyte. The fundamental problem is to determine how CPS can be usefully applied to the identification of toxic components in complex gaseous mixtures of possibly 20 or more compounds. This problem has been addressed, after reviews of the instrument design goals and of the potentially usable instrumental techniques, by the extension of the capabilities of CPS to mixtures of up to three or four detectable compounds, and fractionation of complex combustion product mixtures into simpler mixtures of not more than three or four of such compounds. 2 refs., 1 fig.

37958 **(GSF—37/86) Documentation of publications on the subject of forest damage. As of July 1986.** (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU)). Oct 1986. 529p. (In German). NTIS, PC E99; Available from NTIS as TIB/B87-07076.

The 1912 citations (as of July 1986) are listed in alphabetic order according to the first-named author. Each citation comprises the consecutive number, the author, title, corporate source, and index terms. In the alphabetic subject index, the index terms are listed along with the number of the citation. This permits simple bibliographic searches even without the aid of a computer.

37959 **(LA-UR—87-1748) Work performance evaluation using the exercising rat model.** Stavert, D.M.; Lehnert, B.E. (Los Alamos National Lab., NM (USA)). 1987. Contract W-7405-ENG-36. 5p. (CONF-870887—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE87010131.

From 6. medical chemical defense bioscience review; Baltimore, MD, USA (1 Aug 1987).

A treadmill-metabolic chamber system and a stress testing protocol have been developed to evaluate aerobic work performance on exercising rats that have inhaled toxic substances. The chamber with an enclosed treadmill provides the means to measure the physiologic status of rats during maximal work intensities in terms of $O_2$ consumption ($V_{02}$) and $CO_2$ production (V/sub c02/). The metabolic chamber can also accommodate instrumented rats for more detailed analyses of their cardiopulmonary status, e.g., ECG, cardiac output, arterial blood gases and pH, and arterial and venous blood pressures. For such studies, an arterial/venous catheter preparation is required. Because of the severe metabolic alterations after such surgery, a post surgical recovery strategy using hyperalimentation was developed to ensure maximal performance of instrumented animals during stress testing. Actual work performance studies are conducted using an eight minute stress test protocol in which the rat is subjected to increasing external work. The metabolic state of the animal is measured from resting levels to maximum oxygen consumption (V/sub 02max/). V/sub 02max/ has been shown to be reproducible in individual rats and is a sensitive indicator of oxidant gas-induced pulmonary damage. 3 tabs.

37960 (LMF—115, pp 83-86) **Deposition of ultrafine particles on a human nasal cast.** Cheng, Y.S.; Yeh, H.C.; Swift, D.L. (John Hopkins Univ., Baltimore, MD). Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

This report describes an experimental study of aerosol deposition in a nasal cast. A clear polyester resin cast of the upper airways of a normal human adult was made from a post-mortem negative cast. This life-sized model includes nasal hairs, the nasal airways, nasopharynx and larynx. The measured pressure drop in the cast was similar to the in vivo measurements reported in the literature. The authors measured the total deposition in the cast for monodisperse NaCl aerosols of 0.2 to 0.003 $\mu$m diameter at flow rates between 4 to 60 L/min inspiratory flow. The deposition efficiency increased with decreasing particle size and flow rate, indicating that diffusion was the dominant mechanism. At 20 L/min flow (near the normal breathing flow rate) deposition efficiencies reach 11 and 25% for 0.01 and 0.004 $\mu$m particles, respectively. Their data show that considerable deposition occurs for ultrafine aerosols and this

information should be incorporated into future regional deposition models. 5 references, 3 figures.

37961 (LMF—115, pp 87-90) **Technique for aerosol deposition restricted to the nose in Beagle dogs.** Wolff, R.K.; Whaley, S.L.; Renken, S.; Muggenburg, B.A. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

To aid in better understanding the mechanisms of deposition of particles in the nasal cavity, a method was developed for exposing the nasal cavity of Beagle dogs to a radiolabeled aerosol without exposure of the remainder of the respiratory tract. Deposition efficiency, using a test aerosol of 2.0 μm particles of /sup 99m/Tc-sulfur colloid delivered to the nose, was 15 +/- 2% (mean +/- SE). Maximum deposition occurred in the anterior third of the nasal cavity which contained 78 +/- 4% (mean +/- SE) of the total deposited radioactivity. The middle third of the nasal cavity received 13 +/- 3% and the posterior third 9 +/- 2% of the deposited radioactivity. Gamma camera scintiphotographic imaging detected no aerosol deposited in the lower respiratory tract. 5 references, 1 figure, 1 table.

37962 (LMF—115, pp 91-95) **Model for deposition and long-term disposition of $^{134}$Cs-labeled fused aluminosilicate particles inhaled by guinea pigs.** Snipes, M.B.; McClellan, R.O. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

When considering which laboratory animal species to use in inhalation studies, it is important to evaluate the similarities and differences in deposition and fate of the inhaled materials in various laboratory animals compared with humans. Beagle dogs have deposition and clearance patterns of inhaled particles similar to humans. However, some studies require smaller laboratory animals to be cost effective or to allow an adequate number of animals to address the scientific questions. This study evaluated the deposition and clearance of a relatively insoluble aerosol inhaled by guinea pigs. The test aerosol was monodisperse $^{134}$Cs-labeled fused aluminosilicate particles inhaled during 75 minute inhalation exposure. The guinea pigs had deposition similar to rats but respiratory tract retention and clearance patterns were similar to dogs and humans. 5 references, 2 figures, 1 table.

37963 (LMF—115, pp 96-100) **Comparative simulated lung burdens of dust in rats, guinea pigs, and dogs with chronic inhalation exposures.** Snipes, M.B. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Different species of laboratory animals have characteristic patterns of deposition, retention, and clearance for inhaled materials. Minute respiratory volume, pulmonary deposition fraction for the inhaled material, and clearance parameters influence these patterns. Simulation models using deposition and clearance parameters based on the results of single, acute inhalation exposures were used to make projections for lung burdens accumulated by rats, guinea pigs, and dogs chronically exposed 8 h/day, 5 days/week for 2 years. Results indicate there would be a three-fold difference among these species in the mass of accumulated particles per gram of lung at the end of two years of chronic exposure to the same aerosol. The largest lung burdens would be observed in dogs, the smallest in rats. Conversely, to reach the same target lung burden of particles would require about a three-fold difference in air concentrations of the exposure material. These simulations are useful for helping select the appropriate laboratory animal species to study, for defining aerosol concentrations to use, and for making approximations for lung burdens which would result for defined exposure scenarios. 4 references, 3 figures, 1 table.

37964 (LMF—115, pp 101-104) **Translocation of particles by macrophages from lung to lymph nodes of rats.** Harmsen, A.G.; Gillett, N.A.; Stegelmeir, B. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Rats were instilled intratracheally with 5 x 10$^9$ fluorescent microspheres (1.3 μm diameter) and were killed in groups at 1, 2, 4, and 8 days later. Plastic sections of the tracheobronchial lymph nodes (TBLN) demonstrated that approximately 90% of the translocated microspheres were within macrophages. In addition, the distribution of the numbers of microspheres per TBLN macrophage did not change even though total microspheres in the TBLN increased with time. This suggests that the microspheres arrived at the TBLN within macrophages. To confirm this observation the authors instilled rat lung macrophages, labeled with fluorescent microspheres, into the lungs of syngeneic recipients. Three days later the recipient's TBLN contained labeled macrophages. These results indicate that the macrophages had migrated from the lung to the TBLN and had translocated microspheres in the process. 4 references, 2 figures, 1 table.

37965 (LMF—115, pp 114-120) **Toxicokinetics of beryllium following acute inhalation of BeO by beagle dogs: a status report.** Finch, G.L.; Mewhinney, J.A.; Hoover, M.D.; Harmsen, A.G.; Haley, P.J.; Eidson, A.F.; Bice, D.E. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Beagle dogs were given a single inhalation exposure by nose to radiolabeled beryllium oxide ($^7$BeO) calcined at either 500 or 1000°C for 16 h. Either high (average value 50 μg BeO/kg body weight) or low (average value 17 μg BeO/kg) initial lung burdens (ILBs) were achieved. Whole body, tissue and excreta Be levels were quantified by external gamma-ray counting. Sacrifices were conducted at 8, 32, 64, and 180 days after exposure to examine Be distribution in the tissues. Tissue Be concentrations (normalized to ILB) were independent of the level of ILB. Beryllium oxide calcined at 500°C was cleared more rapidly from the lungs (85% of the ILB cleared at 180 days after exposure) compared with BeO calcined at 1000°C (43% of the ILB cleared at 180 days after exposure). Beryllium cleared from the lungs and not excreted was translocated mostly to the carcass (primarily in bone), tracheobronchial lymph nodes, liver, and blood. The sacrifice of additional dogs in this study is planned for one and two years after exposure. 7 references, 2 figures, 4 tables.

37966 (LMF—115, pp 121-124) **Rapid method for determining soot content of lungs in diesel-exposed rodents.** Henderson, R.F.; Waide, J.J.; Mauderly, J.L.; McClellan, R.O. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Knowledge of the quantity of inhaled material present in the lung provides a better measure of the dose than does the concentration of airborne materials for making inter-species extrapolations of data on the toxicity of airborne materials. To this end, a rapid optical method for determining the quantity of soot in the lungs of rodents exposed to diluted diesel exhaust has been developed. The method is nondestructive to enzymatic components of the lung, allowing dose and biochemical assay to be done on the same sample. The lung burdens of soot were determined by comparing the extinction of light at 620 nm of lung homogenates from exposed animals to that of lung homogenates containing spiked standards. 6 references, 1 figure, 1 table.

37967 (LMF—115, pp 125-129) **Lung retention of inhaled $^{14}$C-BaP and $^{14}$C-NP when adsorbed on carbon particles.** Wolff, R.K.; Sun, J.D.; Barr, E.B.; Rothenberg, S.J.; Yeh, H.C. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Studies were conducted to evaluate the influence of particle association of polycyclic aromatic hydrocarbons on their retention in the respiratory tract. Vaporization and condensation of premixed powders dispersed from a Wright dust feeder were used to produce submicron aerosols of 2% (by mass) $^{14}$C-benzo(a)pyrene (BaP) or 2% $^{14}$C-nitropyrene adsorbed on carbon black (CB). There was close correspondence of the particle size distributions of the $^{14}$C radiolabel, specific for the organic compounds, and the total mass,

representative primarily of the carbon black particles. Following 2 h nose only exposure of rats to these aerosols, lung retention of $^{14}C$ was biphasic. Percentages in the long-term retention component (1.2%. for $^{14}C$-BaP-CB and 3.7% for $^{14}CC$-NP-CB) were much greater than those previously measured for aerosols of the organic compounds alone (0.014% for $^{14}C$-BaP and 0.065% for $^{14}C$-NP). The amount of $^{14}C$ covalently bound to lung macromolecules (as a percentage of inhaled activity) were also much greater for the BaP-CB and NP-CB than for the pure compounds. These data suggest that adsorption of BaP and NP on carbon black enhances interactions with target molecules. 4 references, 4 figures, 1 table.

37968 (LMF—115, pp 130-134) **Factors affecting lung retention of $^{14}C$-benzo(a)pyrene adsorbed on carbon black particles.** Sun, J.D.; Maio, S.M.; Wolff, R.K. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Increased retention of inhaled benzo(a)pyrene (BaP) in lungs when adsorbed to insoluble particles was previously shown. In these studies, male F344 rats were intratracheally instilled with different amounts of $^{14}C$-BaP adsorbed onto carbon black particles at different percentages (0.2%, 2.0% or 20% BaP by mass) or with different amounts of $^{14}C$-BaP not on particles. Clearance of $^{14}C$ from lungs occurred in two phases. The fraction of $^{14}C$ in the long-term component of clearance increased as the percent of adsorbed BaP decreased, but did not change with differing amounts of carbon black particles having the same BaP coating. $^{14}C$ covalently bound to lung macromolecules was greater for the BaP on carbon black particles than for the instilled BaP not on particles. These data indicate that for the same mass of BaP instilled, greater lung retention occurred for the BaP instilled on carbon black. Also, as a percentage of the initial lung burden, retention of particle associated BaP is increased as the amount of BaP adsorbed onto particles is decreased. This increased lung retention may be indicative of the slow leaching of BaP from particles which may allow a larger fraction of this compound to be metabolized to reactive intermediates, rather than being cleared as parent compound. Thus, particle association of organic compounds may not only increase their retention in lungs, but may also increase their toxic/carcinogenic potential by binding to target macromolecules. 5 references, 3 figures, 2 tables.

37969 (LMF—115, pp 135-139) **Physiologically based model 1-nitropyrene metabolism.** Medinsky, M.A.; Hunsberger, S.; Griffith, W.C. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Nitropyrene (NP), a potent bacterial mutagen and a mammalian carcinogen, is a ubiquitous environmental pollutant. A model for the disposition of orally administered NP was constructed using published values for organ volumes and blood flow to organs. Studies in rats suggested that the important organs for NP accumulation after gavage were liver, kidney, and gastrointestinal tract. All other tissues were combined into a single compartment. Model predictions for concentration of NP and metabolites in tissues was compared to experimentally determined data obtained in rats given NP by gavage. The model adequately predicted NP concentrations in liver and the general tissue pool. The concentrations in the kidney were underestimated suggesting that macromolecular covalent binding of metabolites to kidney macromolecules was not adequately considered in the present model and should be incorporated into future revisions of the model. 6 references, 1 figure, 3 tables.

37970 (LMF—115, pp 140-150) **Model analysis of respiratory tract clearance of particles inhaled by people.** Cuddihy, R.G.; Yeh, H.C. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

A mathematical model is described for projecting the deposition and clearance of insoluble particles inhaled by people. The tracheobronchial region is represented by a series of airways having dimensions of a typical lung pathway as determined from measurements on human lung casts. Effective particle clearance velocities in the airways were calculated from measurements of short-term thoracic clearance of radiolabeled particles inhaled by people. These velocities range from 5 mm/min in the trachea to 0.001 mm/min in the terminal bronchioles. Movement of particles from the pulmonary region to the tracheobronchial airways is represented by a daily fractional clearance rate that decreases from $6 \times 10^{-3}$ immediately after inhalation to a constant value of $1 \times 10^{-3}$ beyond 200 days after inhalation. Projections of the model compare favorably with corresponding measurements of respiratory tract clearance in human subjects who inhaled aerosols of different sizes while using different breathing patterns. 23 references, 5 figures, 2 tables.

37971 (LMF—115, pp 283-285) **Changes in collagen and DNA from nickel subsulfide-injured pulmonary alveolar macrophages cultured with lung fibroblasts.** Pickrell, J.A.; Good, D.J.; Benson, J.M.; Brooks, A.L.; Henderson, R.F. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

In order to study mechanisms underlying the cellular-molecular bases of collagen regulation in the lung, pulmonary alveolar macrophages (PAMs) were incubated with control media and media containing a known fibrogenic agent, nickel subsulfide, at varied concentrations. When conditioned media from unexposed PAM was co-cultured for 3 h with human lung fibroblasts growing on a collagen gel subphase, there was an approximate 30% reduction in fibroblast DNA. Neither collagen synthesis nor digestion of the collagen gel by the fibroblasts were affected by the products from unexpected PAM. Exposures of fibroblasts to conditioned media from nickel-exposed PAM increased the amount of DNA in the cultures (25 to 120%) relative to that of fibroblasts treated with media from unexposed PAM. Conditioned media from nickel-exposed PAM also decreased collagen synthesis and digestion of collagen gel by the fibroblasts. These data suggest that conditioned media from PAM cultures exposed to nickel stimulated proliferation of growing lung fibroblasts and reduced their collagen metabolism. 8 references, 1 table.

37972 (LMF—115, pp 286-290) **Cytotoxicity of beryllium compounds to cultured canine alveolar macrophages.** Finch, G.L.; Verburg, R.J.; Mewhinney, J.A.; Eidson, A.F.; Hoover, M.D.; Harmsen, A.G. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Pulmonary alveolar macrophages (PAM) obtained by bronchopulmonary lavage from Beagle dogs were exposed in vitro to beryllium sulfate ($BeSO_4$) or beryllium oxide (BeO) calcined at either 500°C or 1000°C. Biological endpoints quantified included cell viability (determined by trypan blue dye exclusion) and Fc receptor-dependent phago-cytosis (determined by measuring uptake of sheep red blood cells). In the cell viability assay, the most toxic material tested was $BesO_4$, followed by BeO prepared at 500°C, then BeO prepared at 1000°C. Similarly, $BeSO_4$ was more effective in inhibiting PAM phagocytosis of SRBC compared with BeO prepared at 1000°C. Reduced phagocytosis was observed at concentrations at least ten times lower than that required to cause cell killing for all Be compounds tested. This suggests that PAM phagocytosis is more sensitive than viability as an indicator of toxic effects resulting from beryllium exposure. 4 references, 2 figures.

37973 (LMF—115, pp 291-295) **Lung cellular response and lymphocyte blastogenesis.** Harmsen, A.G.; Finch, G.L.; Mewhinney, J.A.; Muggenburg, B.A.; Bice, D.E. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Beagle dogs inhaled aerosols of BeO calcined at 500°C or 1000°C. The initial pulmonary depositions of BeO ranged from 17 to 76 μg BeO per kg body weight. Bronchoalveolar lavage was performed on the exposed dogs at 30, 60, 90, 180, and 210 days. A greater pulmonary neutrophilic and lymphocytophilic response was found to the 500°C-treated BeO as compared to the 1000°C-treated BeO. The dogs exposed to 500°C-treated BeO had lung and peripheral blood lymphocytes that proliferated in vitro following exposure to $BeSO_4$. Only a few of the dogs exposed to 1000°C-treated BeO exhibited peripheral blood lymphocyte responses. These re-

sults suggest that pulmonary deposition in the range of 50 μg BeO per kg body weight calcined at 500°C can induce hypersensitivity lung disease in dogs. It appears that the dog may be a good model for studying Be-induced lung disease. 5 references, 2 figures, 2 tables.

37974 (LMF—115, pp 296-301) **Possible role of reduced glutathione in the development of pulmonary fibrosis.** Sun, J.D.; Pickrell, J.A.; Harkema, J.R.; McLaughlin, S.I.; Henderson, R.F.; Hahn, F.F. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

The capacity of reduced glutathione (GSH) to protect against ozone-induced pulmonary fibrosis was investigated. Mice were exposed to 0, 0.2, 0.5 and 1.0 ppm ozone for 23 h/day for 14 days. During exposures and/or for a period of 90 days after exposures, sub-groups of mice at each exposure level were given drinking water containing 30 mM L-buthionine- S,R-sulfoximine (BSO) to lower in vivo levels of GSH. BSO treatments reduced lung GSH levels by ~50% in all groups. In contrast, ozone exposures increased lung GSH levels in a concentration-dependent manner that was independent of the effects elicited by BSO treatments. Immediately after exposures, an ozone related inflammatory response was seen in the lungs, but no signs of developing fibrosis were evident. However, 90 days later, mice exposed to 1 ppm ozone and treated with BSO during this post-exposure period (regardless of BSO treatment during exposures) showed increased total lung collagen and histopathological evidence of pulmonary fibrosis. These results indicate that lung GSH levels during the tissue-repair period rather than during the time of initial lung injury are important for protection from ozone-induced pulmonary fibrosis. 4 references, 3 figures, 1 table.

37975 (LMF—115, pp 302-305) **Effect of time of glutathione depletion on ozone-induced pulmonary fibrosis.** Kirkpatrick, D.T.; Sun, J.D.; Harkema, J.R.; Pickrell, J.A.; Henderson, R.F. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Exposure to 1 ppm ozone ($O_3$) (14 days, 23 h/day) causes pulmonary fibrosis in mice treated for 90 days after exposure with the tissue glutathione (GSH) decreasing agent, buthionine sulfoximine (BSO). To study the time period during which GSH affects development of fibrosis, male $B6C3F_1$ mice were exposed to $O_3$ and given 30 mM BSO in drinking water for 7, 14, 21 or 90 days after exposure. Lung non-protein sulfhydryl (NPSH), as an estimate of GSH, decreased by ~ 50% in all BSO treatment groups, compared to identically exposed control groups. A 160% increase in lung NPSH induced by $O_3$ was reduced to 75% of normal by a 7-day BSO treatment. Control mice exposed to $O_3$ had no fibrotic changes at 90 days post-exposure, but all mice that received BSO for 7, 14, 21 or 90 days after exposure had areas of interstitial, alveolar duct-associated fibrosis. The decrease in GSH caused by BSO treatment as short as one week post-exposure led to histologically observable fibrosis in mice exposed to $O_3$. The first 7 days following exposure to ozone appears to be a critical time for the observed GSH effect on fibrosis. Increased alveolar macrophage (AM) numbers (lavage AM count 3.7X control at 7 days post exposure) may be involved in this effect. 4 references, 3 figures.

37976 (LMF—115, pp 313-318) **Distribution of microsomal monooxygenases in the rabbit respiratory tract.** Sabourin, P.J.; Dahl, A.R.; Tynes, R.E.; Philpot, R.M. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

The distribution of the cytochrome P-450 isozymes and the FAD-containing monooxygenase in different anatomical regions of the rabbit respiratory tract was determined using immunoblot and enzymatic techniques. P-450 isozyme forms 2, 5, and 6 were found predominantly in the lung tissues although an appreciable amount of isozyme 5 was in maxilloturbinates also. Isozyme 4 was detected in ethmoturbinates and nasal epithelium but not in other respiratory tract tissues. This isozyme appeared to be responsible for the 7-ethoxyresorufin O-deethylase activity in these tissues. Enzymatic analysis indicates that an isozyme other than form 2 was probably responsible for benzphetamine N-demethylation in nasal tissues. Aniline hydroxylase activity, catalyzed by isozyme form 3a in liver, was highest in nasal tissues. The pulmonary form of the FAD-containing monooxygenase was detected in highest in amounts in the lung, but was also detected in other respiratory tract tissues. The qualitative and quantitative differences in monooxygenases in different regions of the respiratory tract may help explain site specific toxicity of chemicals. 6 references, 3 figures, 1 table.

37977 (LMF—115, pp 319-323) **Distribution of xenobiotic metabolizing enzymes in respiratory tract of Beagle dogs.** Bond, J.A.; Harkema, J.R.; Russell, V.I. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Some regions of the respiratory tract (RT) appear more susceptible to the tumorigenic action of inhaled chemicals than are others. Xenobiotic metabolizing enzymes in different regions of the Beagle dog's RT and epithelial cell populations associated with these different regions were characterized. Specific regions from one-half of the nasal (N), tracheal, bronchial, and pulmonary airways (PAs) were excised and analyzed for the presence of xenobiotic metabolizing enzymes. Complementary halves of airways were fixed and processed for light microscopy. Substrates for different isozymes of cytochrome P-450, including benzo(a)pyrene (BaP), nitropyrene (NP), benzphetamine, ethoxycoumarin and ethoxyresorufin were measured. There was a high rate of metabolism of BaP and NP in N tissues and in distal PAs. Less activity was observed in upper tracheobronchial (TB) airways. Most ethoxycoumarin o-deethylase activity was seen in N regions with little activity observed in TB or distal PAs. Only ethmoid turbinates showed evidence of ethyoxyresorufin metabolism. Epoxide hydrolase and glutathione transferase activity appeared evenly distributed along the RT. UDP-glucuronyl transferase activity appeared highest in N tissue and TB airways with less activity in distal PAs. All portions of sampled RT had unique epithelial populations ranging from squamous in proximal N, to olfactory in distal N, and ciliated epithelium in distal PAs. In conclusion, there is an uneven distribution of xenobiotic metabolizing enzymes and epithelial populations along dog RT. Clara cells were not evident in any of the airway epithelia examined. Therefore, other cell types (i.e., ciliated cells, goblet cells, nonciliated cuboidal cells and cells of the olfactory epithelium) are capable of metabolizing xenobiotics. 3 references, 3 figures.

37978 (LMF—115, pp 324-329) **Isolation and characterization of cytochrome P-450 isozymes from mouse liver.** Mitchell, C.E.; Ames, J.; Sabourin, P.J. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

The purpose of these studies was to determine the cytochrome P-450 isozymes responsible for nitroreductase and monooxidase activity in mouse liver that are induced by Aroclor 1254. Liver microsomes from mice treated with Aroclor 1254 were solubilized with sodium cholate and purified by chromatography on aminohexyl sepharose, DEAE-cellulose, and hydroxyapatite columns. Five cytochrome P-450 fractions (A1, A1, A3, B1, B2) were isolated and partially purified. Fraction B2 was the most active in arylhydrocarbon hydroxylase activity, fraction B1 in nitroreductase activity, and fraction A3 in benzphetamine N-demethylase activity. although these fractions the highest in the catalytic activities of specific substrates, some overlapping in substrate specificities was observed for some fractions. Further purification of P-450 fractions to near homogeneity is necessary to determine the absolute number of isozymes of P-450 and their characteristics in induced mouse liver, and subsequently, in uninduced mouse liver and lung and induced lung. 5 references, 3 figures.

37979 (LMF—115, pp 330-336) **Nasal metabolism of benzo[a]pyrene and dihydrosafrole in Beagle dogs and nonhuman primates.** Fischer, J.P.; Whaley, S.L.; Dahl, A.R. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

The purpose of this study was to determine the extent of nasal metabolism of $^{3}$H-dihydrosafrole and $^{14}$C-benzo[a]pyrene ($^{14}$C-BaP) by Beagle dogs and cynomolgus monkeys in two regions of the nasal cavity, the ethmoid (olfactory), and maxillary (respiratory) turbinates. Clearance of these two compounds from the nose was studied by collection of nasopharyngeal mucus, blood, urine, and feces during nasal instillation and up to 48 h afterwards. Analysis of the nasopharyngeal mucus showed that either turbinate region in both species metabolized $^{14}$C-Bap to dihydrodiols, quinones, phenols, and tetrols. $^{3}$H-Dihydrosafrole instilled in either turbinate region was extensively metabolized to 2-methyoxy-4-propylphenol. Other major metabolites were 2-methoxy-4-[2-propenyl]-phenol, and 3,4-methylenedioxy-1-(1-hydroxypropyl)benzene. The present study demonstrated a relatively noninvasive technique for studying regional nasal metabolic capabilities in xenobiotic in vivo. The results show that nasal cavities of dogs and monkeys are capable of metabolizing BaP into biologically significant compounds after instillation at both ethmoid and maxillary turbinates. 6 references, 4 tables.

37980 (LMF—115, pp 337-342) **Detection of DNA adducts formed from metabolites of 1-nitropyrene and 1-8-dinitropyrene in vitro.** Martin, O.S.; Mitchell, C.E.; Bond, J.A. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

DNA adducts were produced in vitro by the incubation of calf thymus DNA with 1-nitropyrene in the presence of xanthine oxidase under anaerobic conditions. Upon analysis by $^{32}$P-post-labeling techniques, it was found that 3 major and 3 minor DNA adducts were formed. One adduct was tentatively identified as N-(deoxyguanosin-8-yl)-1-aminopyrene, which has been observed previously in similar reactions, and comprised 51.5% of total radioactivity recovered as DNA adducts. The other five adducts have not yet been identified. The relative number of these 6 adducts formed in calf thymus DNA ranged from 70 adducts per $10^{6}$ normal nucleotides (for N-(deoxyguanosin-8-yl)- 1-aminopyrene) to 2.4 adducts per $10^{6}$ normal nucleotides. Attempts to produce DNA adducts from 1-nitropyrene or 1,8-dinitropyrene using rat liver microsomes instead of xanthine oxidase were not successful, presumably due to preferential binding of metabolites to microsomal proteins rather than calf thymus DNA. Thus, $^{32}$P-post-labeling techniques were successfully used to determine the number and relative binding of DNA adducts produced in vitro from metabolites of 1-nitropyrene. 8 references, 3 figures, 1 table.

37981 (LMF—115, pp 343-345) **Formation of DNA adducts in mouse tissues after 1-nitropyrene administration.** Mitchell, C.E. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

DNA adducts were isolated and characterized in mouse lung, liver and kidney after intratracheal instillation of [$^{3}$H]-1-nitropyrene (1-NP). HPLC analysis of the enzymatically digested DNA indicated the presence of multiple DNA adducts in mouse lung, liver and kidney. These results indicate that DNA adducts of 1-NP are formed in mouse lung, liver and kidney after intratracheal instillation of 1-NP; the HPLC profiles of the multiple adducts suggests that adducts may be formed via metabolic pathways that involve both nitroreduction and ring-oxidation. 6 references, 1 figure.

37982 (LMF—115, pp 350-352) **Effect of exogenous sources of cysteine on lung glutathione levels.** Kirkpatrick, D.T.; Newkirk, T.M.; Henderson, R.F. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

Tissue glutathione (GSH) is an important cellular protectant from toxic agents. Since exposure of the lung to toxic agents often takes place over extended periods of time and since post-exposure GSH levels have been shown to affect delayed pulmonary effects, it would be useful to induce elevations of lung GSH over extended periods. In the present study, injections with N-acetyl cysteine and oxothiazolidine-carboxylate, two agents which can be converted to cysteine intracellularly, were used in attempts to increase lung GSH. No increase in GSH was found after a 7-day (two 5 mmol/kg B.W. injections per day) treatment regimen with either agent. Ozone ($O_3$) exposure at 1 ppm (23 h/day) during the last 5 days of this treatment did not lead to effective GSH elevation by these agents. From these results, it appears that cysteine-supplying agents, given by serial injection, are not useful for elevation of lung GSH over extended time periods. 3 references, 2 tables.

37983 (LMF—115, pp 353-356) **Biochemical and cellular changes in nasal lavages after intranasal instillation of endotoxin.** Harmsen, A.G.; Harkema, J.R.; Hotchkiss, J.A.; Henderson, R.F. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

In order to study the inflammatory response in the nasal cavity and the role of neutrophils in that response, the authors instilled 500 μg of endotoxin into the nasal cavities of rats. The rats were killed immediately after instillation, or at 0.5, 1, 3, 6 or 24 h after instillation and the nasal cavities lavaged. A neutrophil response which peaked at 6 h was detected in the lavage fluids. The nasal exudate neutrophils had phagocytic ability and $H_2O_2$ production rates similar to those of peripheral blood neutrophils. At 6 h after endotoxin instillation, nasal lavage fluids contained elevated levels of leukotriene $B_4$, thromboxane $B_2$, prostaglandin $E_2$, β-glucuronidase, and alkaline phosphatase. These results suggest that neutrophils may be important in the defense of the nasal mucosal surface and that nasal lavage is a useful means of studying nasal mucosal inflammatory responses. 4 references, 2 figures, 2 tables.

37984 (LMF—115, pp 357-360) **Acute effects of neutrophils on nasal epithelial mucosubstances: quantitative histochemistry.** Harkema, J.R.; Harmsen, A.G.; Hotchkiss, J. Dec 1986. NTIS, PC A22/MF A01. File Number DE87009807.

In Inhalation Toxicology Research Institute: Annual report, October 1, 1985 through September 30, 1986.

F344/N rats were intranasally instilled with endotoxin to elicit a transient influx of neutrophils into the nasal respiratory epithelium. Peak intraepithelial infiltration of neutrophils was observed six h after instillation. A concomitant quantitative decrease in stored epithelial mucosubstance was also observed only at this time after instillation. Amounts of epithelial mucosubstance returned to preneutrophilic-infiltration quantities by 24 h after instillation, when intraepithelial neutrophils were diminishing. Rats depleted of peripheral blood neutrophils had a reduced neutrophilic response to the endotoxin and no concomitant change in the quantity of stored mucosubstance in the nasal epithelium as seen in nondepleted animals. Therefore, neutrophil influx could be responsible in part to the decrease in stored epithelial mucosubstance or hypersecretion often observed in acute airway inflammation. 2 figures.

37985 (NP—7770117) **Trace element analyses in order to determine heavy metal concentrations in lung tissues. A contribution to an objective assessment of occupational hazards.** Baumgardt, B. (Bochum Univ. (Germany, F.R.). Abt. fuer Chemie). 19 Feb 1985. 243p. (In German). NTIS (US Sales Only), PC A11. File Number DE87770117.

The dissertation provides a basis for routine AAS analysis of 10 different trace elements of environmental relevance in lung tissues. The analysis is able to detect Al, Be, Cd, Co, Cr, Cu, Fe, Mn, Ni, and Pb and thus helps doctors to distinguish between normal dust exposure and health hazards from dust exposure.

37986 (NP—7770118) **Effects of environmental factors (food, heavy metals) on teleostean hepatocytes.** Segner, H. (Heidelberg Univ. (Germany, F.R.). Naturwissenschaftlich-Mathematische Gesamtfakultaet). 1985. 328p. (In German). NTIS (US Sales Only), PC A15/MF A01. File Number DE87770118.

The value of teleostean hepatocytes as environmental indicators was investigated by electron microscopy and atomic absorption spectroscopy for the factors 'food' and 'heavy metal contamination'. The cells of liver parenchyma responded to both factors. In case of heavy metal exposure, complex enrichment processes were ob-

served in the liver, depending on the nutritional condition of the animals. The cell reaction is different for different teleostean species; it is too unspecific as a rule to indicate the nature of the determining factor, and it provides information on the extent and intensity of the environmental effects. The latter point is decisive for the value of teleostean hepatocytes as environmental indicators. The findings can be utilized in applied research, e.g. in ecotoxicology and aquaculture. The value of a method based on cytological parameters was illustrated by the development of fish diets.

37987 **(NP—7770123) Uptake and distribution of heavy metals in annelidae, with particular regard to limnic tubificides (oligochaeta).** Back, H.G. (Heidelberg Univ. (Germany, F.R.). Naturwissenschaftlich-Mathematische Gesamtfakultaet). 1985. 167p. (In German). NTIS (US Sales Only), PC A08/MF A01. File Number DE87770123.

The uptake and distribution of Pb, Cd, and Zn were investigated in Tubifex tubifex and Limnodrilus udekemianus (oligochaeta). Further, comparative laboratory and field experiments were made in marine vertebrates. The toxic heavy metals lead and cadmium were preferably taken up by respiratory epithels, e.g. the epidermis of the back end of the tubificides or the gills of Arenica marina (polychaeta). In Nereis diversicolor (polychaeta), the parapodia in which most of the gas exchange takes place were the preferred regions of metal uptake, both in laboratory and field experiments. In limnic tubificides, zinc inhibited the Cd uptake and promoted the Pb uptake. The AAS data and electron microscope data suggest three different uptake mechanisms for Pb (pinocytosis), Cd (facilitated diffusion), and Zn (uptake via an ATP-splitting process).

37988 **(OEFZS—4385) Products formed by photooxidants as factors for new types of forest decline. Results and considerations.** Grossmann, W.D. (Oesterreichisches Forschungszentrum Seibersdorf G.m.b.H. Hauptabteilung Umweltplanung). Feb 1987. 27p. (In German). (NU—33/87). Oesterreichisches Forschungszentrum Seibersdorf G.m.b.H.

Many of the important hypotheses on the new forest decline were checked in the systemic pilot-project Forest Rosalia ('Application of the method of maps over time in Austria'); most have low explanatory power in that research site. Only ozone will cause considerable, but not all damage. Other factors seem to exist which have not been explored until now. Evidence and calculations are supplied that these might be the aldehydes, organic acids, oxidants including peroxides and radicals. These pollutants act together (perhaps even synergistically) with the ozone in a way which might explain extent and form of the new forest decline in wide areas of Austria.

37989 **(OEFZS—4389) Bilateral information meeting Hungary-Austria, subject 'forest decline'.** Cabela, E. (Oesterreichisches Forschungszentrum Seibersdorf G.m.b.H. Hauptabteilung Umweltplanung). Mar 1987. 151p. (In German). (NU—35/87; CONF-861291—). Oesterreichisches Forschungszentrum Seibersdorf G.m.b.H. .

From Bilateral information meeting Hungary-Austria on forest decline; Seibersdorf, Austria (1 Dec 1986).

The report includes 17 lectures by Hungarian and Austrian experts in the field of forest die-off ('Waldsterben').

37990 **(PB—87-137733/XAB) Summary review of the health effects associated with copper: health issue assessment.** Reisman, D.J.; Peirano, W.B.; Lewis, J.B.; Basu, D.K.; Hohrseiter, D. (Environmental Protection Agency, Cincinnati, OH (USA). Office of Environmental Criteria and Assessment). Feb 1987. 87p. (EPA—600/8-87/001). NTIS, PC A05/MF A01.

The Health Assessment Summary Document is a brief review of the scientific knowledge on copper. The emphasis of the document is on inhalation exposure from atmospheric copper and the environmental, ecological, and health effects from the species of copper expected to be present in the atmosphere. The document is the scientific supporting basis for EPA decision-making concerning regulation of copper under the Clean Air Act. Specific scientific documentation on copper under the following headings is found in the document: Physical and Chemical Properties, Analytical Methods, Fate and Transport, Environmental and Exposure Levels, Pharmacokinetics, Toxicology and Human Health Effects. Ambient air exposure to copper adds little to the copper body burden for normal individuals. Human homeostatic mechanisms act to control copper balance in the body. Deficiencies or excesses of copper intake in humans rarely result in copper toxicosis. Special groups of risk include Wilson's disease individuals, children and some populations residing near production and processing facilities.

37991 **(PB—87-169488/XAB) Summarization of recent literature pertaining to an occupational health standard for cadmium. Final report.** (Syracuse Research Corp., NY (USA). Center for Chemical Hazard Assessment). Jun 1980. 102p. (SRC-TR—80-579). NTIS, PC A06/MF A01.

Available information on cadmium was reviewed. Topics discussed included human and animal toxicology, analytical and sampling methods, work practices, and engineering controls. Studies have shown that cadmium is absorbed by the body and distributed to various tissues with the lungs and gastrointestinal tract providing the primary routes of intake and adsorption. Industrial exposure arises mainly through inhalation of cadmium dusts and fumes. Cigarette smoking significantly increases exposure to cadmium through this route. Fumes and dusts produce acute and chronic lung disease and chronic systemic disease. Occupational exposure to cadmium is frequently involved simultaneous with exposure to other metals, complicating the problem of isolating a single causative agent. The kidney is the critical organ for long term effects. The liver is considered to be one of the primary sites of cadmium accumulation and a major site of detoxification. Evidence for cadmium induced hypertension is still unclear. There is little human data concerning the transfer of cadmium across the placenta, uptake and distribution of cadmium in the embryo and fetus, and teratogenic effects. Available data fail to provide conclusive evidence that cadmium causes cancer.

37992 **(PB—87-171682/XAB) Registry of Toxic Effects of Chemical Substances (RTECS), 1986 edition. User's guide to the rtecs computer tape. Annual edition.** Sweet, D.V. (National Inst. for Occupational Safety and Health, Cincinnati, OH (USA)). Feb 1987. 119p. NTIS, PC A06/MF A01.

For system on magnetic tape available as a subscription, see PB—87-900300. Supersedes PB—86-170800.

The 1986 edition of the Registry of Toxic Effects of Chemical Substances (RTECS), formerly known as the Toxic Substances List, is the fifteenth annual revision prepared in compliance with the requirements of Section 20(a)(6) of the Occupational Safety and Health Act of 1970 (Public Law 91-596). The original list was completed on June 28, 1971, and has been updated annually in book format. Beginning in 1977, computer tapes of the complete RTECS file have also been provided. In 1986, these tapes were provided quarterly, in January, April, July, and October. The 1986 edition of the RTECS computer tape, which was issued in January 1987, contains 86,969 substance entries and supersedes all previous RTECS tape editions. A complete description of the various types of data in the RTECS file is contained in the Detailed File Description. The user is strongly encouraged to read this material before processing the data, since the data should not be used until the limitations of the RTECS file regarding data validity, completeness, and applicability are understood.

37993 **(PB—87-175063/XAB) Species comparison of acute inhalation toxicity of ozone and phosgene.** Hatch, G.E.; Slade, R.; Stead, A.G.; Graham, J.A. (Environmental Protection Agency, Research Triangle Park, NC (USA). Health Effects Research Lab.). 1986. 13p. (EPA—600/J-86/288). NTIS, PC A02/MF A01.

Pub. in Jnl. of Toxicology and Environmental Health, Vol. 19, 43-53(1986).

A comparison of the concentration-response effects of inhaled ozone ($O_3$) in different species of laboratory animals was made in order to better understand the influence of the choice of species in inhalation studies of this gas. The effect of 4-hour exposure to ozone ($O_3$) at concentrations of 0.0, 0.2, 0.5, 1.0, and 2.0 ppm was determined in rabbits, guinea pigs, rats, hamsters and mice. Lavage fluid protein (LFP) accumulation 18 hr after exposure was used as the indicator of $O_3$-induced pulmonary edema. All

species had similar basal levels of LFP (250-350 ug/ml) when a volume of saline which approximated the total lung capacity was used for lavage of the collapsed lungs. Exponential dose-response curves were seen in all species except guinea pigs, which showed significant increases in LFP at low $O_3$ concentrations (0.2 ppm) and a leveling off of response at the higher $O_3$ levels. Other species usually showed significant elevations in LFP only at concentrations greater than 0.5 ppm. Recovery of lavage fluid as a percent of the amount of injected saline varied significantly between species, and between $O_3$ concentrations; higher $O_3$ levels causing lower recovery. The time course of LFP accumulation also appeared to vary according to the species.

37994 **(PB—87-175600/XAB) Airway sensitivity of asthmatics to sulfur dioxide.** Horstman, D.; Roger, L.J.; Kehrl, H.; Hazucha, M. (Environmental Protection Agency, Research Triangle Park, NC (USA). Health Effects Research Lab.). 1986. 12p. (EPA—600/J-86/282). NTIS, PC A02/MF A01.

Pub. in J. of Toxicology and Industrial Health, Vol. 2, No. 3, 289-298(1986).

Airways' sensitivity to $SO_2$, ($PC(SO_2)$), was defined as the concentration of $SO_2$ which provoked a 100% increase in specific airways' resistance (SRaw). $PC(SO_2)$ was determined for 2. asthmatics performing moderate exercise while exposed to several concentrations of $SO_2$ up to 2.0 ppm. Substantial variability in sensitivity was observed: for 20% of the subjects, $PC(SO_2)$ was greater than 1.95 ppm $SO_2$, while for the remaining 80%, it ranged between 0.28 and 1.38 ppm $SO_2$. The median $PC(SO_2)$ was 0.75 ppm $SO_2$. $PC(SO_2)$ and nonspecific airways' sensitivity to methacholine were not related.

37995 **(PB—87-175782/XAB) Cadmium technical support document.** (Environmental Protection Agency, Washington, DC (USA). Office of Pesticide Programs). Sep 1986. 90p. (EPA—540/09-077). NTIS, PC A05/MF A01.

This Position Document addresses the risks and benefits of pesticide products containing the subject active ingredient. The Agency has determined that the use of products containing the subject active ingredient may meet or exceed a risk criterion described in 40 CFR Part 154. Potential hazards will be examined further to determine the nature and extent of the risk, and considering the benefits of the subject active ingredient, whether such risks cause unreasonable adverse effects on the environment.

37996 **(PB—87-175824/XAB) Interspecies dosimetry of reactive gases.** Miller, F.J.; Overton, J.H.; Gerrity, T.R.; Graham, R.C. (Environmental Protection Agency, Research Triangle Park, NC (USA). Health Effects Research Lab.). Mar 1987. 36p. (EPA—600/D-87/105). NTIS, PC A03/MF A01.

The development of dosimetry models that can provide a description of the uptake and distribution of inhaled compounds throughout the body and the availability of animal toxicological data are integral components for a full evaluation of potential risks associated with human exposure. Interspecies dosimetric comparisons must be approached using a model conceptualization that incorporates the major factors affecting the uptake of the gas, such as respiratory tract morphology, route of breathing, depth and rate of breathing, physicochemical properties of the gas, etc. Modeling efforts thus far have primarily focused on ozone. A comparison of theoretical predictions of delivered dose of ozone to the lower respiratory tract of man shows good agreement with dose estimates derived from experimental measurements. Applications to ozone toxicological data in animals and man have been examined that incorporate the use of dosimetry models in studying quantitative dose-response relationships.

37997 **(PB—87-175949/XAB) Acute and chronic effects of water-quality-criteria-based metal mixtures on three aquatic species (journal version).** Spehar, R.L.; Fiandt, J.T. (Environmental Protection Agency, Duluth, MN (USA). Environmental Research Lab.). 1986. 17p. (EPA—600/J-86/297). NTIS, PC A02/MF A01.

Pub. in Environmental Toxicology and Chemistry, Vol. 5, 917-931(1986); See also PB—86-122579.

Acute and chronic toxicity tests were conducted with three aquatic species to determine the effects of metals combined as mixtures at proposed water quality criteria concentrations and at multiples of the LC50 and maximum acceptable toxicant concentration (MATC) obtained from tests on six metals. These studies were the first part of a larger research effort to derive water-quality criteria for combined pollutants by the U.S. Environmental Protection Agency.

37998 **(PB—87-179115/XAB) Mercury hazards to fish, wildlife, and invertebrates: a synoptic review.** Eisler, R. (Patuxent Wildlife Research Center, Laurel, MD (USA)). Apr 1987. 102p. (BIOLOGICAL—85(1.10)). NTIS, PC A06/MF A01.

Most authorities agree on six points: (1) Mercury (Hg) and its compounds have no known biological function, their presence in the cells of living organisms is undesirable and potentially hazardous; (2) Forms of Hg with relatively low toxicity can be transformed into forms of very high toxicity, such as methlymercury, through biological and other processes; (3) Hg can be bioconcentrated and biomagnified through food chains; (4) Hg is a mutagen, teratogen, and carcinogen; (5) Some species of fish and wildlife contain normally elevated levels of Hg, not attributable to man's activities. The significance of elevated Hg levels in animal tissues is not fully understood. Usually, however, concentrations in excess of 1100 Hg/kg fresh weight in kidney, brain, blood, hair, or liver should be considered as presumptive evidence of environmental Hg pollution.

37999 **(PB—87-181137/XAB) Effects of acid precipitation on plant diseases.** Bruck, R.I.; Shafer, S.R. (North Carolina State Univ., Raleigh (USA). Dept. of Plant Pathology). 1984. 17p. NTIS, PC A02/MF A01.

Pub. in Direct and Indirect Effects of Acidic Deposition on Vegetation, Acid Precipitation Series, 5, 19-32(1984).

Most plant diseases consist of delicate interactions between higher plants and microorganisms. Acidic precipitation represents an environmental stress that has been shown to affect expected development of some diseases and similar phenomena under experimental conditions. From the perspective of the disease triangle framework, this impact may be expressed through increased plant susceptibility, decreased plant susceptibility through altered metabolic pathways, decreased pathogen activity or increased pathogenicity. Aerial plant parts are directly exposed to rainfall and the potential influence of acidic precipitation on pathogen and diseases of above ground tissues seems obvious. However, soilborne pathogens and root diseases may also be significantly altered by short-term acidification of the soil solution resulting from acid deposition, or by gradual changes in bulk soil chemical characteristics over a long period of time.

38000 **(PB—87-182101/XAB) Effects of contaminants on naiad mollusks (Unionidae): a review.** Havlik, M.E.; Marking, L.L. (Fish and Wildlife Service, Washington, DC (USA)). 1987. 27p. (RESOURCE PUB—164). NTIS, PC A03/MF A01.

Although the uptake, storage, and elimination of contaminants by naiad mollusks has been studied, relatively little information is available on toxicity. Contaminants appear to have destroyed some population directly by exerting toxic effects, or indirectly by causing or contributing to the elimination of essential food organisms or host fish. The most-frequently studied contaminants are Cd, Cu, Mn-Mn54, Pb-Pb210, Zn-Zn65. Manganese seems to be most readily taken up and stored in tissues; no apparent damage has been reported from tissue concentrations of thousands of parts per million (ppm), and the element appears to be essential to metabolism. Zinc and cadmium also accumulate at high levels in tissues. Lead was never found to be lethal in the studies reviewed. Various common contaminants have been reported to be toxic at the following concentrations (ppm): cadmion, 2; copper sulfate, 2 to 18.7; ammonia, 5; potassium, 11; chromium, 12.4; arsenic trioxide, 16; copper, 19; and zinc, 66. In long-term exposures, concentrations of copper as low as 25 parts per billion (ppb) were lethal.

38001 **(PB—87-182697/XAB) Modeling ozone absorption in the lower respiratory tract.** Overton, J.H.; Miller, F.J. (Environmental Protection Agency, Research Triangle Park, NC (USA). Health Effects Research Lab.). Apr 1987. 19p. (EPA—600/D-87/129). NTIS, PC A02/MF A01.

A dosimetry simulation model was developed for predicting the local absorption of ozone in the lower respiratory tract (LRT) of animals and man. The model takes into account species LRT anatomy and ventilatory characteristics, transport in the lumen and air spaces, loss of $O_3$ to the liquid lining, and transport and chemical reactions in the liquid lining and underlying tissues and capillaries. Basic biological concepts and the mathematical formulation of the model are briefly outlined and the results of several investigations presented. Predicted values of LRT uptake are compared to experimental $O_3$ uptake data in humans, showing good agreement over the range of experimental tidal volumes and breathing frequencies. The effect of airway path distance on centriacinar ozone dose is explored; large variations in dose for the first alveolated ducts in a rat are predicted. Human and rat generational doses versus generation are plotted together for comparison; the curves demonstrate a remarkable similarity with regards to shape and structure.

38002 **(PB—87-186151/XAB) Evaluation of the carcinogenicity of unleaded gasoline.** (Environmental Protection Agency, Washington, DC (USA). Office of Health and Environmental Assessment). Apr 1987. 403p. (EPA—600/6-87/001). NTIS, PC A18/MF A01.

In the document the likelihood that unleaded-gasoline vapors are carcinogenic to humans is evaluated. From carcinogenicity data in animals, an estimate is made of the magnitude of cancer risk a person would experience, under the assumption that gasoline vapors are carcinogenic. All biological factors believed to be relevant to carcinogenesis are reviewed. A quantitative analysis of cancer incidence in the two long-term animal gasoline-inhalation studies is performed, an upper-bound cancer risk potency estimate is calculated, and the uncertainties in the estimate are discussed. The major conclusions are: (1) although employment in the petroleum refineries is possibly associated with cancers of the stomach, respiratory system, and lymphopoietic and hematopoietic tissues, exposure to gasoline cannot be implicated as a causative agent because of confounding exposure to other chemicals and inadequate information on gasoline exposure; (2) the occurrence of liver cancer in female mice and kidney cancer in male rats provides sufficient evidence in animals that inhalation of wholly aerosolized gasoline is carcinogenic; and (3) gasoline vapors from vehicle refueling might be less carcinogenic than indicated by animal experiments using wholly aerosolized gasoline, if the less volatile components, which are apparently responsible for acute kidney toxicity, also contribute to the observed carcinogenic response.

38003 **(PB—87-187134/XAB) Comparative potency of complex mixtures: use of short-term genetic bioassays in cancer risk assessment.** Lewtas, J. (Environmental Protection Agency, Research Triangle Park, NC (USA). Health Effects Research Lab.). 1985. 15p. (EPA—600/D-85/273). NTIS, PC A02/MF A01.

Pub. in Short-Term Bioassays in the Analysis of Complex Environmental Mixtures IV, 363-375(1985).

The primary problem regarding the introduction of new energy sources is whether they will alter the mutagenicity, carcinogenicity, and potential human cancer risk from combustion emissions. New risk assessment methodologies utilizing data from short-term bioassays, therefore, are needed to assess new technologies as they are being developed. This will allow the development of alternative combustion and control methods that lower human risk. In order to assess the relative human cancer risk associated with introducing diesel-powered automobiles as an alternative fuel-efficient energy source for transportation, the authors have developed a comparative data base and risk-assessment methodology. This risk-assessment model and methodology is applicable to the evaluation of various complex mixtures. The paper describes a comparative approach to evaluating alternative energy sources by utilizing short-term genetic bioassays.

38004 **(PB—87-188132/XAB) Pulmonary antioxidants.** Massaro, E.J.; Grose, E.C.; Hatch, G.E.; Slade, R. (Environmental Protection Agency, Research Triangle Park, NC (USA). Health Effects Research Lab.). May 1987. 52p. (EPA—600/D-87/143). NTIS, PC A04/MF A01.

One of the most vital of the cellular defenses against pollution is an antioxidant armanentarium which consists of oxidant scavenging molecules such as vitamin E, glutathione, vitamin C, and uric acid as well as a number of enzymes (superoxide dismutase, semidehydroascorbate reductase, catalase, GSH synthetase, GSH peroxidase, GSH reductase, and GSH transferase) and appears to function in keeping oxidant forces under control. Pollutants can upset the oxidant/antioxidant balance of cells by inhibiting vital enzymes, by reacting with oxidant scavengers, or by forming free radical intermediates which initiate uncontrolled tissue reactions with molecular oxygen. The book chapter reviews possible interactions between pollutants and the oxidant/antioxidant balance.

38005 **(PB—87-900300/XAB) Registry of Toxic Effects of Chemical Substances (RTECS), 1986 computer tape. Data files.** Sweet, D.V.; Fang, J.; Shiang, D. (National Inst. for Occupational Safety and Health, Cincinnati, OH (USA)). 1986. mag tap. NTISSubscription.

Supersedes PB—86-165768; Source tape is in the EBCDIC character set. This restricts preparation to 9 track, one-half inch tape only. Identify recording mode by specifying density only. Call NTIS Computer Products if you have questions. Price includes documentation, PB—87-171682. Available on subscription, North American Continent price $2000.00/year; all others write for quote. Issued quarterly.

These tapes contain the data and bibliographic CODEN files of the 1986 Registry of Toxic Effects of Chemical Substances (RTECS). Formerly known as the Toxic Substances List, the Registry is an annual compendium of toxicity data abstracted from the scientific literature by the National Institute for Occupational Safety and Health (NIOSH) in compliance with the Occupational Safety and Health Act of 1970. The 1986 RTECS file contains 310,300 entries; 86,969 are names of unique chemicals with their associated toxicity data and 223,331 entries are synonymous names. For each compound, the following data are provided: prime name and synonyms, CAS number, molecular weights and formulas, date when substance record was last updated, Wiswesser Line Notations irritation, mutation, reproductive effects, tumorigenic, and toxic dose data with references; toxicology reviews; carcinogenic assessments; government standards and regulations; ACGIH-Threshold Limit Values; NIOSH Recommended Exposure Limits; Current Intelligence Bulletins and Analytical Methods; NTP bioassay results; and EPA status. The Registry provides information on known toxic and biological effects of chemical substances for use by employers, employees, physicians, industrial hygienists, toxicologists, researchers, and others concerned with the safe handling of chemicals. The absence of a substance from the Registry does not indicate that it is not toxic. The toxic doses presented are not to be considered definitive doses for describing safe versus toxic doses for human exposure.

38006 **(PNL—5979) Analysis of medium-BTU gasification condensates, June 1985-June 1986.** Elliott, D.C. (Pacific Northwest Lab., Richland, WA (USA)). May 1987. Contract AC06-76RL01830. 58p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87011107.

This report provides the final results of chemical and physical analysis of condensates from biomass gasification systems which are part of the US Department of Energy Biomass Thermochemical Conversion Program. The work described in detail in this report involves extensive analysis of condensates from four medium-BTU gasifiers. The analyses include elemental analysis, ash, moisture, heating value, density, specific chemical analysis, ash, moisture, heating value, density, specific chemical analysis (gas chromatography/mass spectrometry, infrared spectrophotometry, Carbon-13 nuclear magnetic resonance spectrometry) and Ames Assay. This work was an extension of a broader study earlier completed of the condensates of all the gasifers and pyrolyzers in the Biomass Thermochemical Conversion Program. The analytical data demonstrates the wide range of chemical composition of the organics recoverd in the condensates and suggests a direct relationship

between operating temperature and chemical composition of the condensates. A continuous pathway of thermal degradation of the tar components as a function of temperature is proposed. Variations in the chemical composition of the organic in the tars are reflected in the physical properties of tars and phase stability in relation to water in the condensate. The biological activity appears to be limited to the tars produced at high temperatures as a result of formation of polycyclic aromatic hydrocarbons in high concentrations. Future studies of the time/temperature relationship to tar composition and the effect of processing atmosphere should be undertaken. Further processing of the condensates either as wastewater treatment or upgrading of the organics to useful products is also recommended. 15 refs., 4 figs., 4 tabs.

38007 **(UCRL—96644) Molecular approaches to the detection of germinal mutations in mammalian organisms, including man.** Mohrenweiser, H.W.; Branscomb, E.W. (Lawrence Livermore National Lab., CA (USA)). May 1987. Contract W-7405-ENG-48. 13p. (CONF-8703142—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE87010871.

From New trends in genetic risk assessment meeting; Nice, France (9 Mar 1987).

The need for estimates of human germinal mutation rates arises from the need to define the mutation rate, the associated health burden, and the spectrum of "spontaneous" germinal mutational lesions in unexposed subjects, and the need to monitor the suspected increase in mutation rate in populations exposed to known or suspected genotoxic agents. It must be possible to analyze, in a meaningful manner, the frequency and spectrum of mutational events in relatively small populations. Therefore, it is critical that a large portion of the genome in each proband is screened, otherwise, given the anticipated limitation on the number of individuals in the study population, it will not be possible to obtain a statistically significant data base. It is also important that the method(s) detect the spectrum of molecular lesions, so that significant increases in the mutation rate are not missed because a class of mutational event was not identified. Since most of the human risk estimates will be derived from data generated in model systems and test animals, rather than from data derived from studies of human populations, the data bases generated in human studies must serve as reference points for extrapolation from test systems. 45 refs.

38008 **Anaerobic catabolism of formate to acetate and $CO_2$ by Butyribacterium methylotrophicum.** Kerby, R.; Zeikus, J.G. (Upjohn Co., Kalamazoo, MI). *Journal of Bacteriology;* **169**: No. 5, 2063-2068(May 1987). Contract FG02-85ER13376.

The catabolism of sodium formate to acetate and carbon dioxide by the anaerobic acetogen Butyribacterium methylotrophicum was analyzed by fermentation time course and $^{13}C$ nuclear magnetic resonance studies. Significant hydrogen production and consumption fluxes were observed during formate catabolism but not during the catabolism of formate plus CO. In the latter case, formate and CO were simultaneously consumed and label distribution studies with mixtures of $^{13}C$-labeled CO and formate demonstrated their preferential incorporation into the acetate carboxyl and methyl groups, respectively. Hydrogen consumption was inhibited by CO when both were present, whereas hydrogen and formate were simultaneously consumed when $CO_2$ was supplied. Carbon dioxide was required for the conversion of CO to acetate, but a similar need was not observed when methanol plus CO or formate plus CO was present. These analyses indicate a bifurcated single-carbon catabolic pathway in which $CO_2$ is the sole single-carbon compound that directly supplies the carbonyl and methyl group synthesis pathways leading to the formation of acetyl coenzyme A, the primary reduced product. The authors discuss causes for the reported inability of B. methylotrophicum to use formate as a sole substrate.

38009 **Metabolism of gallate and phloroglucinol in Eubacterium oxidoreducens via 3-hydroxyl-5-oxohexanoate.** Krumholz, L.R.; Crawford, R.L.; Hemling, M.E.; Bryant, M.P. (Univ. of Illinois, Urbana). *Journal of Bacteriology;* **169**: No. 5, 1886-1890(May 1987). Contract AC02-81ER10874.

The pathway for anaerobic catabolism of gallic acid by Eubacterium oxidoreducans was studied by using both in vivo and cell-free systems. Cells grown with gallate and crotonate, but with no formate or $H_2$, excreted pyrogallol and phloroglucinol into the medium. Gallate was decarboxylated by crude cell extracts, with pyrogallol as the only detectable product. Whole cells converted pyrogallol to phloroglucinol. A phloroglucinol reductase catalyzed the conversion of phloroglucinol to dihydrophloroglucinol when NADPH was used as the source of electrons. Both formate dehydrogenase and hydrogenase were present in cell extracts of gallate-formate-grown cells. These two enzymes were both NADP linked. Since either $H_2$ or formate is required for cell growth with gallate or phloroglucinol, these results suggest that the oxidation of the reduced substrate may be indirectly linked to the reduction of phloroglucinol. A dihydrophloroglucinol hydrolase was present, which hydrolyzed dihydrophloroglucinol to 3-hydroxy-5-oxohexanoate. This six-carbon ring cleavage product then presumably can be broken down by a series of reactions similar to $\beta$-oxidation. These reactions cleaved the six-carbon acid to 3-hydroxybutyryl-coenzyme A yielding acetate and butyrate as end products. A number of key enzymes involved in $\beta$-oxidation and substrate-level phosphorylation were demonstrated in cell extracts.

38010 **Kinetic flow dichroism study of conformational changes in supercoiled DNA induced by ethidium bromide and noncovalent and covalent binding of benzo[a]pyrene diol epoxide.** Yoshida, H.; Swenberg, C.E.; Geacintov, N.E. (Armed Forces Radiobiology Research Institute, Bethesda, MD). *Biochemistry;* **26**: No. 5, 1351-1358(10 Mar 1987). Contract FG02-86ER60405;AC02-78EV04959.

The dynamic conformational changes due to the noncovalent intercalative binding of ethidium bromide and racemic trans-7,8-dihydroxy-anti-9,10-epoxy-7,8,9,10-tetrahydrobenzo[a]pyrene (BPDE), and the covalent binding of BPDE to supercoiled phi X174 DNA, have been studied by gel electrophoresis and a novel application of a kinetic flow linear dichroism technique. The magnitude of the linear dichroism of the DNA oriented in the flow gradient is sensitive to the hydrodynamic shape of the DNA molecule which is affected by the binding of the drug or the carcinogen BPDE. The kinetic flow dichroism spectra indicate that the noncovalent BPDE-DNA complexes are intercalative in nature, while the covalent adducts are characterized by a very different conformation in which the long axes of the pyrenyl residues are oriented at a large angle with respect to the average orientation of the planes of the DNA bases. These results suggest that conformations of carcinogen-DNA adducts, other than intercalative ones, can cause the unwinding of superhelical DNA. The flow dichroism method is capable of following kinetically changes not only in the shapes, and thus conformations of supercoiled DNA molecules, but also in the conformations of drugs or carcinogens causing these changes.

38012 **(AD-A—179275/3/XAB) Metabolic effects of microwave radiation and convection heating on human mononuclear leukocytes. Final report, January 1985-May 1986.** Kiel, J.L.; Wong, L.S.; Erwin, D.N. (School of Aerospace Medicine, Brooks AFB, TX (USA)). 1986. 9p. (USAFSAM-JA—86-43). NTIS, PC A02/MF A01.

Pub. in Physiological Chemistry and Physics and Medical NMR, Vol. 18, 181-187(1986).

Investigated here were the effects of microwave (MW) radiation (2450-MHz, continuous-wave, mean specific absorption rate of 103.5 + or - 4.2 W/kg) and convention heating on the nonphosphorylating oxidative metabolism of human peripheral mononuclear

leukocytes (96% lymphocytes, 4% monocytes) at 37 C. Metabolic activity, determined by chemiluminescence (CL) of cells challenged with luminol (5-aminO-2, 3-dihydro-1, 4-phthalazinedione) linked to bovine serum albumin, was detected with a brightness photomer. A significant stimulation after after MW exposure ($p < 0.005$) over total CL of matched 37 C-incubator controls was observed. A similar degree of stimulation, compared to incubator controls, was also detected after sham treatment. No significant difference existed between changes in total CL or stimulation indices of the MW and sham-exposed groups. Exposure to MW radiation, under normothermic (37 + or - 0.03 C) conditions, appears to have no effect on the oxidative metabolic activity of human peripheral mononuclear leukocytes. However, the significant differences between MW or sham-exposed cells and their respective incubator controls occurred because the temperature of the incubator did not exceed 35.9 C, and 39 minutes were required for the temperature to rise from 22 to 35.9 C. Slow heating of incubator controls must be accounted for in thermal and redio-frequency radiation studies in vitro.

38013 **(AD-A—180111/7/XAB) Evaluation of drugs for prevention of hyperthermia in rats exposed to microwave irradiation. Final report, 1983-1985.** Knepton, J.; Cobb, B. (Naval Aerospace Medical Research Lab., Pensacola, FL (USA)). 4 Mar 1987. 17p. (NAMRL—1328). NTIS, PC A02/MF A01.

The objective of this study was to determine the effectiveness of two antipyretic drugs, indomethacin and dihydrotachysterol, in the prevention of microwave-induced hyperthermia in rats. Indomethacin has been proven effective in reducing fever of pyrogenic origin. Dihydrotachysterol (DHT) is effective in increasing survival of rats during heat stress. After being acclimated to restraint in an acrylic cone-shaped holder and to the presence of a colonic temperature probe each rat was subjected to a series of body-temperature measurements under various drug and microwave conditions. Pretreatment with both drugs consisted of single and multiple injections prior to microwave exposure. Multiple does of DHT caused a progressive fall in baseline body temperature, but did not affect the relative increase in temperatures due to microwave irradiation. Single-injection procedures did not reduce temperature elevation due to microwave irradiation. Neither indomethacin nor DHT were found to ameliorate microwave-induced hyperthermia.

38014 **(NP—7770114) Study investigating the impact of aircraft noise on physiological, endocrinological and ethological criteria with regard to pregnant sows, roaming free or kept in barns.** Schriever, K. (Tieraerztliche Hochschule Hannover (Germany, F.R.)). 20 Jun 1985. 134p. (In German). NTIS (US Sales Only), PC A07/MF A01. File Number DE87770114.

Twenty-one sows in different stages of pregnancy were subjected to stress induced by 123 overflight events of airplanes on 9 days altogether (3 x 3 days). Ten of the sows were roaming free in the pasture and 11 of them were kept in single ranging in a closed barn. The following observations were registered in order to answer the question whether aircraft, flying at low altitudes do provoke reactions which will lead to adaption or to exhaustion of the adrenal cortex and whether reproduction is affected: noise pressure level, slope, duration and frequency pattern of the noise of the aircraft; altitude and speed of the different aircraft during the overflight events; concentration of plasma estrogens and progesterone overall plasma corticoids; video recordings and notes to evaluate the behaviour of the animals. The results permit the following statements: The general behaviour of the sows was not affected over a long range; the kind and intensity of the reaction does not only depend on acoustical but also on optical and tactile impressions as well as on the degree of adaption; there are indications of an adaption to the overflight events which could be observed within the series of overflights as well as from day to day; there were no injuries or accidents in connection with the overflights which could have caused abortions; rises in plasma corticoid levels which were directly related to the overflights hint towards a severe strain on the animals; an influence on the plasma estrogens and progesterone concentrations could not be observed and all data recorded showed differences in the individual reaction of the animals.

38015 **(LA-tr—87-13) Pressure and intracorporal acceleration measurements in pigs exposed to strong shock waves in a free field.** Vassout, P.; Franke, R.; Parmentier, G.; Evrard, G.; Dancer, A. (Los Alamos National Lab., NM (USA); Institut Franco-Allemand de Recherches de Saint-Louis, 68 (France)). 1987. Contract W-7405-ENG-36. Translation of ISL-R—112/86. 30p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87011135.

A theoretical study on the propagation of a pressure wave in a diphasic medium, when compared to the onset mechanism of pulmonary lesions in subjects exposed to strong shock waves, shows an increase in the incident overpressure at the interface level. Using hydrophones, intracorporal pressure was measured in pigs. The authors recorded the costal wall acceleration on the side directly exposed to the shock wave and calculated the displacement of the costal wall after a shock wave passed by. These experiments were conducted for shock waves in a free field, at an overpressure peak level ranging from 26 kFPa to 380 kPa and for a first positive phase lasting 2 ms. Sensors placed in an intracorporal position detected no increase of the overpressure level for any value of the incident pressure. A comparison of the costal wall displacement, measured experimentally, relative to the theoretical displacement of the entire animal mass indicates that the largest relative displacement of the costal wall could be the origin of the pulmonary lesions found. 5 refs., 13 figs.

# 57 HEALTH AND SAFETY

38016 **(PNL-SA—14976) The application of expert systems to the analysis of logic trees.** Franklin, A.L. (Pacific Northwest Lab., Richland, WA (USA)). Jun 1987. Contract AC06-76RL01830. 13p. (CONF-870657—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011994.

From Personal computer applications in the gas industry; Chicago, IL, USA (22 Jun 1987).

Fault trees are a subject of logic trees. An application developed for the US Bureau of Mines uses artificial intelligence techniques to improve the availability of information contained in logic tree representations. FALTS (Failure Analysis and Logic Tree System) is a generalized knowledge-based system package designed to organize, identify, and communicate logic tree information. FALTS has been developed to provide a forum for investigating and preserving information describing the interdependencies of system components and subcomponents. The basic premise behind FALTS is that the representation and analysis of component dependencies can be standardized while specific dependency information can vary from system to system. The processing abilities of FALTS gives it the appearance of a logic tree analyst expert. Given a sufficient system description, FALTS is capable of identifying the logical pathways leading to a particular event, the base events involved in any particular pathway, and the sequence of event that would result from the occurrence of a particular combination of base events. It is intended that FALTS be used as a predictive system for interfacing mine safety officials with the status and potential circumstances of mine operations. However, FALTS has been generalized to be used outside the mining industry.

38017 **(UCRL—95561) Pressure safety training for a large research and development facility.** Kotowski, M.J. (Lawrence Livermore National Lab., CA (USA)). 19 May 1987. Contract W-7405-ENG-48. 16p. (CONF-8709106—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87009850.

From Conference on safety in handling glass; Annecy, France (16 Sep 1987).

The LLNL pressure safety program works. We have very few mishaps, and there has been only one injury accident in recent years. In that case, our pressure safety program had been ignored. We believe that it is the most comprehensive and successful program of its kind in the US. The LLNL pressure safety program is successful because it is comprehensive and addresses the needs of all our employees who work with pressure. Pressure safety training is the element that makes the program work and assures almost complete cooperation by all employees. This enables us to continue our work with hazardous materials under pressure.

# 58 GEOSCIENCES

38018 (AD-A—179430/4/XAB) **Medium- and long-wave infrared absorption spectra of carbon dioxide and nitrous oxide at 800k.** Barowy, W.M.; Esplin, M.P.; Vanasse, G.A.; Huppi, R.J. (Utah State Univ., Bedford, MA (USA). Stewart Radiance Lab.). 8 Jan 1987. 63p. (SCIENTIFIC—21). NTIS, PC A04/MF A01.

A high resolution interferometer was used to measure the medium- and long-wave infrared absorption spectra of carbon dioxide and nitrous oxide heated to 800K. Modifications were made to the instrument to improve its wavelength accuracy and reliability. In the 4.3-micrometer region, 5 bands of (12)C(16)O(18)O were identified and the corresponding spectral constants were reduced. The constants reproduce the position of the spectra lines to within 0.0005/cm. Absorption spectra of $N_2O$ and $CO_2$ in the 7.8 and 15-micrometer regions, respectively, were recorded and their preliminary analysis has been completed.

38019 (CONF-8608141—, pp 119-129) **Influence of site disturbance on $\delta^{13}C$ isotopic time series from tree rings.** Leavitt, S.W.; Long, A. (Univ. of Wisconsin, Parkside). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

In this study, the authors examined three types of disturbances which, in principal, could influence $\delta^{13}C$ of trees through their effect on light levels, nutrients and plant health. These disturbances include forest fire and selective cutting events at the Thomas Creek watershed in Arizona, and spruce budworm defoliation at the Capulin site in New Mexico. The results give some evidence of elevated $\delta^{13}C$ values in trees affected by defoliation and deforestation. However, even if real, the isotopic deviations are subtle rather than large, distinctive and disturbance-specific. Thus, influence of these types of site disturbances on long tree-ring time series may well be minor, and therefore ecologic reconstructions from these time series would be difficult. 10 references, 4 figures.

38020 (CONF-8608141—, pp 213-223) **Late Holocene sediment yield and transport in a northern Arizona drainage basin reconstructed by tree-ring analysis.** Alexander, V.; McCord, S. (Univ. of Arizona, Tucson). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Rates of slope degradation can be estimated from the age and depth of exposure of the roots of long-lived trees. Rates of aggradation can be estimated from depth of burial and the time since death of trees buried by alluvium. Dead Juniper Wash, a tributary of Dinnebito Wash on Black Mesa, Arizona, provides an opportunity to make a detailed reconstruction of Holocene erosion rates and sediment transport and storage history. Many of the pinyon and juniper trees growing on the hillslopes of this drainage basin have their roots exposed to various depths by erosion of the underlying Cretaceous sandstone and siltstone (Wepo Fm). The drainage bottoms are filled with several meters of Holocene sediments containing abundant buried juniper trees with germination dates extending back to before 1400 AD. In the lower reaches the buried trees are being exhumed by arroyo cutting, but in the upper reaches and near the sides living trees are currently being buried by alluvium derived from the hillslopes. Death dates range from the 1500's and 1600's in the center of the basin up to the present near the edges of the sedimentary body. Analysis of tree-ring materials from this site indicates an average erosion rate of 0.33mm/yr over the last 650 years, a total sediment yield of about $10^6$ $m^3$ during this time, and that about half of this sediment has been stored in the sedimentary body in the drainage bottom. 23 references, 8 figures.

38021 (CONF-8608141—, pp 261-271) **Regeneration of baldcypress (Taxodium distichum (L.) Rich.) as related to drought in the LaBranche wetlands of Southern Louisiana.** Conner, W.H.; Mueller, R.A. (Louisiana State Univ., Baton Rouge). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

It is commonly stated in the scientific literature that ideal conditions for baldcypress regeneration occur on the order of every 30 to 50 years during extreme dry years, and this results in baldcypress stands being made up of even-aged groups of trees. However, no one has ever undertaken to determine the age structure of a stand of baldcypress tress and look at the historical climate record to determine if the trees did become established at the time most suited for their survival- a drought of one to two growing seasons. In this study, tree slabs were taken from 50 small baldcypress saplings and tree cores from 35 large trees to determine if it was possible to group trees into age classes. A computerized water budget program was used to compare the hydrologic variables since 1871 with the physioecology of baldcypress. Indications are that this technique may be an excellent means of correlating age of the stand of trees with drought conditions predicted by the water budget. 32 references, 5 figures.

38022 (CONF-8608141—, pp 272-280) **Annual rings of trees from Central Amazonian inundation forests.** Worbes, M.; Leuschner, H. (Max-Planck-Institut fuer Limnologie, Ploen, West Germany). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

The periodical growth zones of trees from Central Amazonian inundation forests represent annual rings. Combined investigations of wood anatomy, tree-ring analyses and radiocarbon dating allow the age of tropical trees to be determined and show in the present case connections between the growth rhythm of trees and the duration of annual flooding. Defoliation behavior of Varzea trees and results of wood anatomy investigations indicate that cambial dormancy is an adaptive strategy to periodical floodings. 21 references, 7 figures.

38023 (CONF-8608141—, pp 290) **Dating landslides in Hudson Bay area, Quebec.** Begin, C.; Filion, L. (Universite Laval, Sainte-Foy, Quebec). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

A 12-km long terrace along the estuary of the Grande riviere de la Baleine (55°-17'N, 77°47'W) has been locally modified by seven large landslides during the last 3200 $^{14}C$-yr BP. The three oldest landslides were radiocarbon-dated from buried organic material and occurred between 3200 and 900 BP. The more recent landslides were dendrochronologically dated. They were formed in less than 30 years, i.e. in 1818 (2 synchronous landslides), 1839 and 1846. These 19th-century landslides were dated through a comparative analysis of growth curves derived from the buried trees found in the flowing sediments, with the master chronologies from Jacoby and Parker et al, and the northern Quebec light-ring chronology, more specifically the 1816 and 1817 light-ring years. The 1818 landslides occurred during the growing season (July), whereas the 1839 and 1846 landslides were formed during springtime. The occurrence of numerous landslides during this short interval seem to be related to sustained cool and humid climatic conditions that may have enhanced the subsoil water content.

38024 (CONF-8608141—, pp 291-297e) **Late Glacial reforestation in the Swiss mittelland and in Wisconsin illustrated by the Daettnau and the Two Creeks buried forests.** Kaiser, K.F. Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

The Daettnau late glacial forest is located in a drainage channel formed by melted ice between the Rhine-Lake of Constance Glacier and the Rhine-Linth Glacier to the SW of Win-

terthur, Switzerland. Buried wood from birches and pines, pollen and mollusc deposits laid down during the Late Glacial and extending into the early Boreal after the transition to the Post-glacial were studied. It was possible to reconstruct the vegetational and climatic developments. The Late Glacial in Central Europe is seen to have comprised two intervals: the continuous, moist, warm Boelling/Alleroed zone, and the subsequent dry, cold Younger Dryas. The beginning of the Boelling is clearly indicated by fossil wood, pollen and mollusc remains, as is the transition from Alleroed to the Younger Dryas. The subsequent change-over to the Post-glacial is reflected in the pollen record. The firs $\delta^{18}O$ measurements ever made on land snails show a clear distinction between Alleroed and the Younger Dryas. The large coincidence between Daettnau and other location shows, that the development of this late-glacial forest cannot be classified as a purely local occurrence. It can only be explained as a result of large-scale climatic changes. In contrast to the Daettnau, the Two Creeks Forest evolved into wide open country. The trees found more variability in their local growing conditions, a fact which makes dendrochronological correlation very difficult. While the Daettnau pines held out in the shelter of a drainage channel for one and a half millenia, the growth of the Two Creeks Forest lasted only a bit longer than two centuries. 19 references, 9 figures.

38025 (CONF-8608141—, pp 298-318) **Dendrochronological study of oak trunks found in bogs in northwest Germany.** Leuschner, H.H.; Delorme, A.; Hoefle, H.C. (Univ. of Goettingen, West Germany). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Altogether, 977 subfossil oak trunks from 44 bogs in Lower Saxony have been dendrochronologically analyzed and provide a continuous chronology from 5543 BC to 928 AD. Profile description of the trunk-bearing horizons and analysis of the accompanying peat indicate that the oaks grew on mineral soil and were later preserved in growing peak or they grew on fen during dry periods. In the latter case, they were irregularly distributed in fenwoods consisting primarily of alders and birches. Periods of waterlogging associated with an increase in peat growth resulted in the demise of the oaks. Climate fluctuations caused oaks to die off over wide areas, later becoming covered by peat. These phases occurred especially in the following periods: 4900-4400 BC, 1750 - 1525 BC, 300 - 100 BC, and 330 - 550 AD. 24 references, 7 figures.

38026 (CONF-8608141—, pp 319-326) **Productivity in fossil forests.** Creber, G.T.; Francis, J.E. (Univ. of London, England). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Fossil wood is found abundantly throughout the geological column from the Upper Devonian to the present day. Much of its is in the form of Loose trunks, branches and roots but occasionally the actual stumps of a fossil forest have become fossilized in situ. If growth rings are discernible in the stumps, the productivity can be estimated and related to the light energy input to the forest. Total forest productivity may be estimated from bole productivity. Single-tree productivity may be calculated from isolated trunks or stumps in which the rings can be measured. The productivity may be expressed as the quantity of wood produced in one year by unit area of the cambium. From this figures a minimum light-intercepting area of the crown may be estimated. Another method which may be used utilizes both the ring width and the radius of the cambial cylinder that gives rise to the ring. 18 references, 4 figures, 2 tables.

38027 (CONF-8608141—, pp 327-336) **Tree-ring studies and the reconstruction of woodland management practices in antiquity.** Crone, A. (Univ. of Sheffield, Yorkshire, England). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

By the early Medieval period a system of management, known as coppice-with-standards, had evolved, representing the optimal exploitation of the fragment of remaining woodland. The main feature of this system was the exploitation of relatively large areas of coppiced wood. Coppicing exploits the fact that virtually all native British deciduous trees, when felled, produce vigorous new shoots from the stump. Coppiced stems are characterized by their rapid growth rates branch-free morphology and an unusually wide inner ring, indicative of the exceptional rate of their first year's growth. This paper is addressed specifically to the problem of detecting formal coppicing from the patterns preserved in wood from archaeological contexts and differentiating between this and the adventitious harvesting of naturally occurring coppiced wood.

38028 (CONF-8608141—, pp 337-342) **Dendrochronology and documents in Exeter, South West England.** Mill, C.M. (Sheffield Univ., England). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

A wealth of oak (Quercus spp.) timers are preserved in the medieval roofs of Exeter Cathedral with 160 trusses above the high vaults alone. Altogether these contain about 1500 timbers, a significant proportion of which retain some or all of their sapwood. A remarkable series of contemporary medieval documents relating to the cathedral's construction in the thirteenth and fourteenth centuries have survived. These fabric accounts give week by week details of the sums spent on labor and materials, and often mention the source woodland and felling dates for batches of timbers being brought to the cathedral. Obviously, this type of information greatly enhances the potential of the timber assemblage and may enable the study of some particular problems associated with giving and interpreting dates of oak timbers. The research also aims to clarify the roof-building sequence. The architectural history of the cathedral has been the subject of many studies and the fabric accounts give much relevant detail. However the accounts for some years are missing and many entries are obscure and difficult to interpret, so there remain areas of uncertainty which dendrochronology may be able to resolve. Tree-ring dates may also be able to explain some puzzling features of the roof structure.

38029 (CONF-8608141—, pp 343) **Tree-ring reconstruction of Indian-Cree tree harvesting in the area, Quebec, Poste-de-la-Baleine.** Delwaide, A.; Filion, L. (Universite Laval, Sainte-Foy, Quebec). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

The development of subarctic white spruce forests around Poste-de-la-Baleine has been controlled in part by Indian and Hudson's Bay Company activities, as indicated by a dendroecological analysis. About 200 Indian camp-sites and cutting areas were dendrochronologically dated and mapped. Three major periods of forest use were defined. Before 1953, the cutting activities were mostly done during the summer season. Heating of Hudson's Bay Company houses most likely the primary cause of the important tree cuttings that occurred during this period. Between 1954-1973, the forests have been progressively influenced by Indian activities. The cutting operations were increasing, particularly around the village, which suggests that wood was carried there in a significant amount as a domestic fuel. Since 1973, an important decrease in wood use was noticed, most likely associated with a shift in cultural change. Several ecological impacts of tree cutting on subarctic forests were evaluated. The vegetation response to these impacts has been 1. the development of distinctive growth-forms associated with traumatic reiterations, 2. a significant growth release in trees living close to the cutting sites, and 3. local successional tree regeneration process, associated with climate, clearing intensity, and physical conditions of ground vegetation following cutting.

38030 (CONF-8608141—, pp 401) **Environmental stresses and residual variation in European tree-ring data after climatic influence is removed.** Braeker, O.U. (Swiss Forest Research Institute, Birmensdorf). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

The European network of 104 subalpine sites with recent chronologies of 200-300 years has been condensed into 23 regional

chronologies. These regional chronologies have been used with climatic information to establish climatic models. The application of defined models is used to calculate estimates of ring-widths and densities and to calculate residuals. The residuals (as non-climatic information) are discussed in relation to ecological and anthropogenic changes. The Swiss sample-network of tree-cores in the SANASILVA-inventory of 1984 has been measured. The ring-widths are discussed on a regional and local level in relation to increased environmental stresses (forest decline).

38031 (CONF-8608141—, pp 647-650) **Direct reading x-ray densitometer.** Jozsa, L.A.; Myronuk, R.S. (Forintek Canada Corp., Vancouver, British Columbia). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

A Direct Reading X-Ray Densitometry (DRXRD) system was designed in conjunction with a special sample preparation saw capable of cutting unmounted five mm diameter increment cores. The first phase of the work was to evaluate present-day technology that utilized either a radioactive isotope or an X-ray energy source for measuring wood density directly, i.e., not using photographic processes. The second phase of this project was to design the new Forintek DRXRD system. To be cost-effective and to ensure reliability the design was to incorporate off-the-shelf items wherever possible. The DRXRD was to include the following main components; X-ray energy source with a power supply, wood sample transport system, X-ray detector and amplifier, sample imaging system, and a safety interlock circuitry.

38032 (CONF-8608141—, pp 651-657) **Thin-section technique for X-ray densitometric analysis of narrow tree-ring series.** Telewski, F.W.; Burns, J.M.; Ulan, L. (Univ. of Arizona, Tucson). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

A technique for thin sectioning wood for X-ray densitometric analysis is described. The method uses a modified sliding micr,tome and is capable of cutting uniform strips of wood between 0.40 and 0.06 mm thick. A thinner section of wood increases the resolution of narrow tree-ring series by reducing small variability in fiber angle associated with axial tracheids and ring boundaries and by reducing the amount of X-ray scatter within the wood sample. The technique also reduces the amount of processing time associated with other methods of sample preparation during cutting. 4 references, 4 figures, 2 tables.

38033 (CONF-8608141—, pp 658-665) **Progress in the image analysis of tree rings.** Yanosky, T.M.; Robinove, C.J.; Clark, R.G. (Geological Survey). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Ring boundaries of increment cores were mapped automatically on digitized images by a convolution filter that emphasizes differences in surficial brightness between latewood and earlywood. Pixel brightness values were also measured along radial and tangential parts of individual rings and ring series. Brightness mapping and profiling can be used to detect and measure structural features correlative with factors affecting ring development, and may possibly generate data for long-term climatic reconstructions. Problems and suggestions for future research are discussed. 2 references, 4 figures.

38034 (CONF-8608141—, pp 666-670) **How to observe tree-ring without really cutting.** Onoe, M. Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

The authors have found computed tomography (CT) is an ideal nondestructive method for observing tree-rings. CT is a technique to reconstruct a true crosssectional distribution of some physical property of a test object from a set of projection data. Projection is a line integral of the distributed property along a certain angle of view. A number of projections at different positions and angles are necessary to yield an acceptable reconstruction. These projections can be physically measured from the outside of the test object. For the measurement of projections, any ray or particles, which are strong enough to pass through an object, may be used.

38035 (CONF-8608141—, pp 671-689) **Potential in using elemental concentrations in radial increments of old growth eastern red cedar to examine the chemical history of the environment.** Guyette, R.; McGinnes, E.A. Jr. (Univ. of Missouri, Columbia). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Research examines the potential of utilizing elemental concentrations in the wood of eastern red cedar (Juniperus virginiana L.) to make inferences about past changes in atmospheric and site chemistry. Crossdated growth increments from live trees and remnant wood are analyzed by neutron activation analysis (NAA) and inductively coupled plasma optical emission spectroscopy (ICP Scan) for elements with potential environmental information. Radial heartwood ring series from 300 to 700 years in length are analyzed in 20 year increments for 37 different elements. Evidence for minimal radial translocation of elements in the heartwood is presented. The radial concentration of elements in the bole is found to be coincident with early smelting activities. 7 references, 4 figures.

38036 (CONF-8608141—, pp 707-717) **Method to obtain thin cross-sections for tree-ring analysis.** Biondi, F. (Univ. of Arizona, Tucson). Apr 1987. NTIS, PC A99/MF A01. File Number DE87009045.

From Industrial symposium on ecological aspects of tree ring analysis; Tarrytown, NY, USA (17 Aug 1986).

Wood cross-sections 1.2-2.0 mm thick were obtained using a common radial arm saw. A special clamp mounted on the saw table and connected to an air compressor held the wood specimen in place during each saw cut. The maximum depth of the saw cut limited the vertical dimension of the specimen, while the size of the saw table and the mutual position of saw and clamp limited the two horizontal dimensions of the specimen. A pipe covered with mosquito-net and connected to a vacuum source was used to catch the thin section when cut. High quality thin sections of both angiosperms and conifers were easily prepared and used for tree-ring dating and ring-width measuring. Thin transverse sections are easily stored and transported in large numbers even if the available room is small. Their minimal size and weight simplify any operation that requires handling a lot of wood cross-sections. 12 references, 11 figures, 1 table.

38037 **(LBL—23477) MINC [Multiple Interacting Continua]: An approach for analyzing transport in strongly heterogeneous systems.** Narasimhan, T.N.; Pruess, K. (Lawrence Berkeley Lab., CA (USA)). May 1987. Contract AC03-76SF00098. 21p. (CONF-8706137—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011224.

From NATO advanced research workshop on advances in analytical and numerical groundwater flow and quality modeling; Lisbon, Portugal (2 Jun 1987).

We consider systems in which materials of low-diffusivity occur as islands in pervasive high-diffusivity materials. In these systems, global three dimensional transport occurs in the high-diffusivity materials. Transport in the low-diffusivity materials is local and one-dimensional in nature. MINC (Multiple Interacting Continua) is a method for efficiently simulating transport in such systems. The Integral Finite Difference Method (IFDM) provides a convenient way for implementing MINC. Known information on the shape and the size of the blocks can be judiciously utilized to obtain improved accuracy in estimating transport into the islands. MINC permits handling of continua at several hierarchial levels.

38038 **(NEI-DK—28) Model for simulating the variation in the oxygen isotope ratio in the meltwater discharge from the marginal zone of the Inland Ice at Pakitsup akuliarusersua, Jakobshavn.** Reeh, N.; Thomsen, H.H. (Groenlands Geologiske Undersoegelse, Copenhagen (Denmark)). Aug 1986. 37p. (In Danish). NTIS (US Sales Only), PC A03/MF A01. File Number DE87752472.

This report describes a model for simulating the variation in the oxygen isotope ratio in the meltwater discharge from the mar-

ginal zone of the Inland Ice. The model has been developed to investigate whether the natural variation in the isotopic composition of the surface ice can give information about the extent of the hydrological basins on the Inland Ice. The meltwater drainage systems on the ice margin are described, and the problems involved in delineating the drainage basins are mentioned. The background for the model is given in term of a description of the natural variation in the isotopic composition of the surface ice of the ice margin. Previous applications of stable isotope studies related to glacier-hydrological investigations in Greenland are shortly reviewed. The results of the simulation for the marginal zone of the Inland Ice at Pakitsup akuliarusersua indicate that isotope studies can contribute useful information about the area versus elevation distribution and the development of the ablation area through the melt season. The differences between the observed isotope ratios of water samples from three proglacial lakes are qualitatively in agreement with the corresponding differences, and the deviations between observed and simulated values can be understood. Collection of additional isotope data in the area will improve the quality of the simulation and thereby provide background for safer conclusions as regards the delineation of the hydrological drainage basins on the Inland Ice. (EG).

38039 **(ORNL/TM—10112) Subsurface-controlled geological maps for the Y-12 plant and adjacent areas of Bear Creek Valley.** King, H.L.; Haase, C.S. (Oak Ridge National Lab., TN (USA)). Apr 1987. Contract AC05-84OR21400. 67p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87011961.

Bear Creek Valley in the vicinity of the US Department of Energy Y-12 Plant is underlain by Middle to Late Cambrian strata of the Conasauga Group. The group consists of interbedded limestones, shales, mudstones, and siltstones, and it can be divided into six discrete formations. Bear Creek Valley is bordered on the north by Pine Ridge, which is underlain by sandstones, siltstones, and shales of the Rome Formation, and on the south by Chestnut Ridge, which is underlain by dolostones of the Knox Group. Subsurface-controlled geological maps illustrating stratigraphic data and formational contacts for the formations within the Conasauga Group have been prepared for the Y-12 Plant vicinity and selected areas in Bear Creek Valley westward from the plant. The maps are consistent with all available surface and subsurface data for areas where sufficient data exist to make map construction feasible. 13 refs.

38040 **(TVA/ONRED/AWR—87/6) Floods on East Fork Mulberry Creek and Price Branch in the vicinity of Lynchburg, Tennessee.** (Tennessee Valley Authority, Knoxville (USA). Office of Natural Resources and Economic Development; Tennessee Valley Authority, Knoxville (USA). Div. of Air and Water Resources). Nov 1986. 54p. NTIS, PC A04/MF A01. File Number DE87900851.

This flood hazard information report describes the extent and severity of the possible flooding along selected reaches of those streams listed above for watershed and channel conditions as of March 1986. It was prepared by TVA in response to a request from the town of Lynchburg for up-to-date information regarding the flood potential along the studied stream reaches in order to assist the town to better administer its floodplain management program. Detailed information is provided concerning the current flood threat along the studied stream reaches. The report does not propose plans for the solution of identified flood problems. Rather, it provides the flood information needed to make informed decisions regarding the use of flood-prone lands within the study area.

38041 **(AD-A—179539/2/XAB) Studies of infrared aurorae. Technical report.** Fox, J.L. (Utah State Univ., Logan (USA). Center for Space Engineering). 3 Nov 1986. 51p. (CSE—86-139). NTIS, PC A04/MF A01.

Smithsonian researchers began their studies of infrared aurorae by computing the rate of vibrational excitation of $N_2$ by the impact of energetic electrons. Although the radiative lifetime of vibrationally excited $N_2$ is long, infrared emission may appear as a result of V-V transfer from $N_2$ to molecules that may radiate, such as $CO_2$ and NO. A complete set of cross sections was compiled for electron-impact excitation of vibrational levels $v = 1$ through $v = 6$ for the impact of electrons with energies from 2 to 200 eV. They found that for high electron energies and low fractional ionizations, about 6% of the total energy of the electron appears as vibrational excitation.

38042 **(IFP—33-507) Numerical simulation of marine seismic source signature and of their interaction. Application to the watergun.** Le Mentec, O. (SEE CODE- 9100855 Institut Francais du Petrole (IFP), 92 - Rueil-Malmaison). 20 Sep 1985. 150p. (In French). NTIS (US Sales Only), MF A01. File Number DE87751771.

A marine seismic source creates one or many bubbles in water. The bubble movement generates an acoustic wave which propagates first in water and then underground. To simulate: a source signature creating an isolated bubble, we present, analyse, and fit the "spherical model" to explosive and implosive source case. The interaction phenomenon is related to bubble deformation during their movements. The simulation method has been fitted to the water gun HWG400. Stages of the simulation are:water jet modelling, bubble evolution simulation, two bubble interaction modelling. The algorithm developed allows to simulate signature and spectrum of a set of water guns, whatever is the source and hydrophone position.

(Lawrence Berkeley Lab., CA (USA)). Jan 1987. Contract AC03-76SF00098. 10p. (CONF-870815—2). NTIS, PC A02. File Number DE87006147.

From 6. International Society for Rock Mechanics congress; Montreal, Canada (30 Aug 1987).

The results of a comprehensive laboratory study of the mechanical displacement, permeability, and void geometry of single rock fractures in a quartz monzonite are summarized and analyzed. A metal-injection technique was developed that provided quantitative data on the precise geometry of the void spaces between the fracture surfaces and the areas of contact at different stresses. At effective stresses of less than 20 MPa fluid flow was proportional to the mean fracture aperture raised to a power greater than 3. As stress was increased, contact area was increased and void spaces become interconnected by small tortuous channels that constitute the principal impediment to fluid flow. At effective stresses higher than 20 MPa, the mean fracture aperture continued to diminish with increasing stress, but this had little effect on flow because the small tortuous flow channels deformed little with increasing stress.

38044 **(LBL—22747) Generation and analysis of stable excavation shapes under high rock stresses.** Ewy, R.T.; Kemeny, J.M.; Zheng, Z.; Cook, N.G.W. (Lawrence Berkeley Lab., CA (USA); California Univ., Berkeley (USA). Dept. of Materials Science and Mineral Engineering). Jan 1987. Contract AC03-76SF00098. 11p. (CONF-870815—3). NTIS, PC A02. File Number DE87006944.

From 6. International Society for Rock Mechanics congress; Montreal, Canada (30 Aug 1987).

Failure criteria based on micromechanical models of splitting failure and shear failure are implemented in boundary element programs to analyze the stability of various two-dimensional excavation shapes under high stress. A technique for modeling the failure processes of progressive spalling, shear, and tensile failure is developed and is used to simulate the formation of stable shapes through progressive failure. The shapes resulting from initially circular openings are strikingly similar to those recognized widely as wellbore breakouts. All the shapes studied lead to the formation of

pointed breakout regions, and these final shapes are stable with respect to splitting, shear, and tensile failure. The size of the failed region is smaller for the case of gradually increasing field stress around a preexisting opening than for an opening made instantaneously in rock with preexisting stress.

38045 **(PNL-SA—14276) Trace rare earth element analysis in briny groundwaters.** Laul, J.C.; Lepel, E.A.; Smith, M.R. (Pacific Northwest Lab., Richland, WA (USA)). Aug 1986. Contract AC06-76RL01830. 5p. (CONF-870430—13). NTIS, PC A02/MF A01; GPO Dep. File Number DE87011185.

From International conference on methods and applications of radioanalytical chemistry; Kona, HI, USA (5 Apr 1987).

A rare-earth element (REE) group separation scheme has been developed. REE data for two briny groundwaters representing Granite Wash and Wolfcamp Carbonate formations are reported. (DLC)

38046 **(SAND—85-7100) The SPECTROM-31 Compliant Joint Model: A preliminary description and feasibility study: Nevada Nuclear Waste Storage Investigations project.** Labreche, D.A.; Petney, S.V. (RE/SPEC, Inc., Albuquerque, NM (USA); Sandia National Labs., Albuquerque, NM (USA)). Jun 1987. Contract AC04-76DP00789. 75p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87011576.

A deformable continuum joint model, the Compliant Joint Model, has been incorporated into the two-dimensional finite-element computer program SPECTROM-31. The stress-deformation response of a joint set normal to its plane of orientation is elastic and hyperbolic in form. The shear stress-deformation response of the joint set tangent to its plane of orientation is linear elastic. The response of up to four arbitrarily oriented joint sets is combined with the linear elastic response of the matrix component of the model to form an anisotropic nonlinear elastic composite material. The inherent numerical difficulties associated with the iterative solution of complex problems with such nonlinear models led to a preliminary investigation of the feasibility of employing the Compliant Joint Model in large finite-element models. Primary factors affecting the degree of difficulty in obtaining the numerical solution were identified as the initial stress state and loading history, joint orientation and degree of dispersion, and degrees of freedom in the model. The collective importance of these factors focuses on their effect on the composite stiffness of the material and the associated potential for an ill-conditioning of the stiffness matrix. 6 refs., 6 figs., 9 tabs.

38047 **(SAND—87-1227) A finite element material model for microfracture-damaged brittle rock.** Costin, L.S.; Stone, C.M. (Sandia National Labs., Albuquerque, NM (USA)). Jun 1987. Contract AC04-76DP00789. 87p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87012511.

A continuum damage model based on the mechanics of microcrack growth has been implemented in the finite element code SANCHO. The model incorporates the effects of the nucleation, growth and coalescence of microcracks on the deformation of brittle materials, such as rock, under compressive loading. The material subroutine keeps track of both the magnitude and direction of microcrack growth in each element so that the induced anisotropy due to crack growth in preferred directions and the stress history dependence of microcrack growth are properly taken into account. In addition, the model allows for interaction among neighboring microcracks, which leads to coalescence and subsequent material failure or softening. A damage vector, which is calculated from the crack distribution in each element, is used as an internal variable to compute the effective elastic moduli at each stage of the deformation. Results of several sample calculations using the model are presented and methods for determining the required material parameters are discussed.

38048 **(UCRL—96585) Brittle fracture phenomena: An hypothesis.** Britton, K.; Walton, O.R. (Lawrence Livermore National Lab., CA (USA)). 1 May 1987. Contract W-7405-ENG-48. 24p. (CONF-870867—4). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010247.

From 2. international symposium on rock fragmentation by blasting; Keystone, CO, USA (23 Aug 1987).

It is proposed that: volumetric dilation is a fundamental requirement for brittle fracture involving shear; such dilation commonly involves or is expressed as zonal overpressures; the overpressured zones radiate particle motions which are significant to or dominate seismic radiation from blasting; the overpressures are commonly significant to and may dominate the energetics of blastings. Outstanding problems and gaps in our knowledge regarding fragmentation are discussed. It is argued that there is a common missing factor, dilatancy. Supporting evidence is presented from soils and rock mechanics, blasting experimental data and blasting experience. Computer modeling of fragmentation is discussed and the necessity for the inclusion of dilatancy established. Implications are discussed and a test of the hypothesis proposed.

This report presents hydrographic data collected as part of the first phase of the Shelf Edge Exchange Processes (SEEP) program. The SEEP program is a multi-institutional effort to investigate the flux of suspended material from the continental shelf into the waters of the upper slope and thence, possibly, into the slope sediments. During the field portion of the program, current, temperature, conductivity, fluorescence, and transmission sensing instruments were deployed across the outer continental shelf and onto the continental slope. 382 CTD casts were made where temperature, salinity, dissolved oxygen, transmission, and fluorescence data were collected. Expendable bathythermograph (XBT) data were collected sporadically but are not included in this report. This report describes the processing and calibration of the CTD data and presents the data in a series of representative temperature and salinity correlation diagrams and cross-isobath transects.

38050 **(AD-A—179331/4/XAB) Program of ground-based astronomy to complement Einstein observations. Final report, 1 October 1981-30 September 1986.** Helfand, D.J. (Columbia Univ., New York (USA). Columbia Astrophysics Lab.). Dec 1986. 14p. (CAL—1629). NTIS, PC A02/MF A01.

Our program of multiwavelength observational investigations and their attendant interpretive studies concerning problems in stellar coronae, supernova remnants, and neutron-star astrophysics continued in FY 86. A variety of important projects were undertaken, several of which reached completion in the last year of the five-year period (1 October 1981 to 30 September 1986), including the compilation of the complete x-ray flux-limited sample of M stars, a study of small-scale anisotropy of the extragalactic x-ray background, and a definitive paper on the new class of composite SNRs. A total of 26 papers presenting the results of the program were published or accepted for publication in the technical literature, as well as six review articles for conference proceedings. A total of 35 presentations were given at regional, national, and international meetings by the principal investigator, two co-investiga-

tors, and/or the six graduate students supported under this program. In addition, radio and optical observations under several existing proposals were conducted and more than twenty new proposals were prepared, the majority of which have already been accepted.

38051 **(AD-A—179513/7/XAB) High-energy neutral radiations from the sun.** Chupp, E.L. (New Hampshire Univ., Durham (USA). Dept. of Physics). 1984. 16p. NTIS, PC A02/MF A01.

Pub. in Annual Review Astronomy Astrophysics, Vol. 22, 359-387(1984).

Only recently with the launch of the Solar Maximum Mission and Hinotori satellites, has it been possible to routinely detect high-energy neutral (gamma ray and neutron) radial ions from the sun to identify them with confidence, and to study their properties. The new observations require revisions in earlier concepts, particularly those concerning particle acceleration. This review describes SMM and other relevant observations, and discusses some of the exciting implications and questions that these data raise.

38052 **(AD-A—179545/9/XAB) Vector-array-processor computer equipment. Final report, 1 January-31 December 1985.** Toomre, J. (Colorado Univ., Boulder (USA). Dept. of Astrophysical, Planetary, and Atmospheric Sciences). 6 Feb 1987. 16p. NTIS, PC A02/MF A01.

To support the on-going research on Solar Oscillations and Convective Flows as Probes of Structure in the Subphotosphere, a vector-array-processor system was acquired to augment the existing DEC VAX-11/750 computer system. The fifty-fold average increase in computing speed offered by the array processor would make it feasible to invert solar-oscillation data on a regular basis, and thereby permit use of the five-minute oscillations of the Sun to probe the turbulent convection zone below the surface. The array processor also permits detailed numerical experiments with compressible convection in the presence of magnetic fields, for the speed and memory of the machine makes it a formidable tool for direct numerical simulations of two- and three-dimensional fluid dynamics. Such theoretical simulations are also needed to study the solar dynamo and its ability to build and transform magnetic fields, an issue central to solar-terrestrial variablility and predictions of solar activity. Attached as Appendix A is a cover article in Science Magazine that describes the importance of the work on the Seismology of the Sun that is beginning to emerge from the class of array processors.

38053 **(AD-A—179584/8/XAB) Very Large Array observations of the sun with related observations using the SMM (Solar Maximum Mission) satellite. Interim report, 1 January-31 December 1986.** Lang, K.R. (Tufts Univ., Medford, MA (USA). Dept. of Physics and Astronomy). 31 Jan 1986. 81p. NTIS, PC A05/MF A01.

Observations of solar-active regions with the Very Large Array (VLA) and with the Solar Maximum Mission (SMM) satellite are providing new insights to the origin and prediction of solar activity. This activity includes bursts or flares that can disrupt the tracking of satellites, distort communication systems, and interfere with high-flying aircraft. These bursts originate in coronal loops that are uniquely studied with the VLA (at 20 cm wavelength) and with the SMM (at x-ray wavelengths). The research summarized includes discussions of coronal diagnostics, solar-burst precursors, and energy buildup in coronal loops. Novel discoveries of coherent burst mechanisms on nearby active stars other than the sun. VLA observations of a solar-noise storm (at 92-cm wavelength) have resolved the sources of storm radiation for the first time. Future VLA observations with the new 92-cm system will provide new information about the unknown processes that trigger and continually excite solar noise storms, while also providing insights to the unknown triggering mechanisms for decimetric bursts and coronal mass ejections. This report includes reprints, preprints or abstracts of articles prepared under this grant.

38054 **(AD-A—179650/7/XAB) Solar-active region physical parameters inferred from a thermal cyclotron line and soft-x-ray spectral lines.** Lang, K.R.; Willson, R.F.; Smith, K.L.; Strong, K.T. (Tufts Univ., Medford, MA (USA). Dept. of Physics and Astronomy). 1986. 22p. NTIS, PC A02/MF A01.

Simultaneous high-resolution observations of coronal loops are presented at 20-cm wavelength with the Very Large Array and at soft-x-ray wavelengths. The images at 20-cm and soft-x-ray wavelengths have nearly identical sizes and ellipsoidal shapes, with a linear extent of about 5 cm. This emission stretches between and across regions of opposite magnetic polarity in the underlying photosphere. Complete x-ray coronal loops can therefore be imaged at 20 cm, and the VLA maps describe the radio wavelength counterpart of x-ray coronal loops. x-ray spectral lines were used to obtain values of electron temperature and electron density averaged over the emitting area. The absence of detectable circular polarization is consistent with an optically thick plasma. The observed brightness temperature was roughly equal to the electron temperature of the coronal plasma. The VLA maps at 10 closely spaced frequencies between 1440 and 1720 MHz describe the same coronal loops or arcades of loops. A plot of the maximum-brightness temperature of these loops as a function of observing frequency exhibits a line-like feature with a central frequency of 1650 MHz and a half width of 80 MHz. This spectral feature is attributed to a thermal-cyclotron line and indicates that the optical depth of thermal gyro-resonance radiation must be greater than that of thermal bremsstrahlung at these frequencies.

38055 **(AD-A—179664/8/XAB) VLA (Very Large Array) observations of a solar-noise storm.** Lang, K.R.; Willson, R.F. (Tufts Univ., Medford, MA (USA). Dept. of Physics and Astronomy). 1986. 20p. NTIS, PC A02/MF A01.

The first Very Large Array (VLA) observations of the sun at 92-cm wavelength (328 MHz) are presented. A solar-noise storm, which lasted at least 3 hours, was detected at this wavelength; it consisted of burst-like spikes superimposed on a slowly varying background, and both storm components were 95 + or - 5% right-hand circularly polarized. A long-duration soft-x-ray event preceded the radio radiation by 30 m, suggesting a disturbance moving outwards at a velocity of v = 78 km/s. The 92-cm noise storm was resolved with an angular resolution of 9 sec for time intervals as short as 13 s. During the onset and early phases, the storm consisted of four compact sources, each with an angular diameter of 40 sec, oriented within an elongated source with angular dimensions of 40 sec by 200 sec. During the subsequent hour, the most-intense emission was located in two 40-sec sources separated by 100 sec. Snapshot maps revealed a persistent elongated source at successive peaks, with a scatter in the source position. A systematic position shift of Deta Theta/sub I/ > or = 15 sec can be produced by the Earth's ionosphere, but these effects can be removed by frequent observations of a nearby calibrator source. The observations confirm previously reported trends for a decrease in source size at higher frequencies, but they suggest a hitherto unresolved complexity in source structure.

38056 **(AD-A—179698/6/XAB) Simultaneous SMM flat-crystal spectrometer and Very Large Array observations of solar-active regions.** Lang, K.R.; Willson, R.F.; Smith, K.L.; Strong, K.T. (Tufts Univ., Medford, MA (USA). Dept. of Physics and Astronomy). 1986. 27p. NTIS, PC A03/MF A01.

High-resolution images of the quiescent emission from two solar-active regions are compared at 20-cm (VLA) and soft-x-ray (SMM-FCS) wavelengths. There are regions where the x-ray coronal loops have been completely imaged at 20-cm wavelength. In other regions, the x-ray radiation was detected without detectable 20-cm radiation, and vice versa. The x-ray data were used to infer average electron temperatures Te of about 3,000000 K and average electron densities of about 2.5 x $10^9/cm^3$ for the x-ray-emitting plasma in the two active regions. The thermal bremsstrahlung of the x-ray-emitting plasma is probably optically thin at 20-cm wavelength. Although the 20-cm brightness temperatures TB were always less than Te, suggesting optically thin layers, the thermal gyroresonance radiation from the x-ray-emitting plasma ought to be

optically thick at 20-cm wavelength. The low TB can be explained if a higher, cooler plasma covers the hotter x-ray-emitting plasma. Thermal gyroresonance radiation must account for the intense 20-cm radiation near and above sunspots where no x-ray radiation is detected. The potential of 20-cm (VLA) and soft x-ray (SMM-FCS) comparisons is discussed.

38057 **(DOE/ER/40272—32) On the evolution of global strings in the early universe.** Harari, D.; Sikivie, P. (Florida Univ., Gainesville (USA). Dept. of Physics). [1987]. Contract FG05-86ER40272. 13p. (UFTP—87-4). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87008766.

We find that a bent global string straightens itself out by dissipation into Nambu-Goldstone (NG) bosons in the order of one oscillation time and that the spectrum of radiated NG bosons is 1/k. In the early universe, the assumption that there is one global string per causal horizon is justified after an initial period during which the effect of the primordial plasma on the motion of the strings is non-negligible. We find that the upper bound that axion radiation by strings places on the axion decay constant is comparable to, but not more stringent than the one derived from coherent oscillations of the axion field, i.e., f/sub a/ $\leqq 10^{12}$ GeV. We also discuss the model-dependence of this bound. 12 refs.

38058 **(FNAL/Pub—87/77-A) Cosmic strings in an expanding spacetime.** Stein-Schabes, J.A.; Burd, A.B. (Fermi National Accelerator Lab., Batavia, IL (USA); Sussex Univ., Brighton (UK)). Apr 1987. Contract AC02-76CH03000. 27p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87010939.

We investigate the stability of a static, infinitely long and straight vacuum string solution under inhomogeneous axisymmetric time-dependent perturbations. We find it to be perturbatively stable. We further extend our work by finding a string solutions in an expanding Universe. The back reaction of the string on the gravitational field has been ignored. The background is assumed to be a Friedman-Robertson-Walker (FRW) cosmology. By numerically integrating the field equations in a radiation and matter dominated models, we discover oscillatory solutions. The possible damping of these oscillations is discussed. For late times the solution becomes identical to the static one studied in the first part of the paper. 19 refs., 8 figs.

38059 (N—87-20665, pp vp) **Forecasts of solar and geomagnetic activity.** Joselyn, J. Feb 1987. NTIS, PC A13/MF A01. (NASA-CP—2460; M—548; NAS—1.55:2460).

In Upper and Middle Atmospheric Density Modeling Requirements for Spacecraft Design and Operations.

Forecasts of solar and geomagnetic activity are critical since these quantities are such important inputs to the thermospheric density models. At this time in the history of solar science there is no way to make such a forecast from first principles. Physical theory applied to the Sun is developing rapidly, but is still primitive. Techniques used for forecasting depend upon the observations over about 130 years, which is only twelve solar cycles. It has been noted that even-numbered cycles systematically tend to be smaller than the odd-numbered ones by about 20 percent. Another observation is that for the last 12 cycle pairs, an even-numbered sunspot cycle looks rather like the next odd-numbered cycle, but with the top cut off. These observations are examples of approximate periodicities that forecasters try to use to achieve some insight into the nature of an upcoming cycle. Another new and useful forecasting aid is a correlation that has been noted between geomagnetic indices and the size of the next solar cycle. Some best estimates are given concerning both activities.

38060 (N—87-20665, pp vp) **NASA/MSFC prediction techniques.** Smith, R.E. Feb 1987. NTIS, PC A13/MF A01. (NASA-CP—2460; M—548; NAS—1.55:2460).

In Upper and Middle Atmospheric Density Modeling Requirements for Spacecraft Design and Operations.

The NASA/MSFC method of forecasting is more formal than NOAA's. The data are smoothed by the Lagrangian method and linear regression prediction techniques are used. The solar activity period is fixed at 11 years--the mean period of all previous cycles. Interestingly, the present prediction for the time of the next solar minimum is February or March of 1987, which, within the uncertainties of two methods, can be taken to be the same as the NOAA result.

38061 **(N—87-20860) Collisional dynamics of perturbed particle disks in the solar system. Annual technical progress report.** Roberts, W.W.; Stewart, G.R. (Virginia Univ., Charlottesville (USA)). Mar 1987. 11p. (NASA-CR—180497; NAS—1.26:180497; UVA—528253/AM87/101). NTIS, PC A02/MF A01.

Investigations of the collisional evolution of particulate disks subject to the gravitational perturbation of a more massive particle orbiting within the disk are underway. Both numerical N-body simulations using a novel collision algorithm and analytical kinetic theory are being employed to extend our understanding of perturbed disks in planetary rings and during the formation of the solar system. Particular problems proposed for investigation are: (1) The development and testing of general criteria for a small moonlet to clear a gap and produce observable morphological features in planetary rings; (2) The development of detailed models of collisional damping of the wavy edges observed on the Encke division of Saturn's A ring; and (3) The determination of the extent of runaway growth of the few largest planetesimals during the early stages of planetary accretion.

38062 **(N—87-20947) Statistical aspects of solar flares.** Wilson, R.M. (National Aeronautics and Space Administration, Huntsville, AL (USA). George C. Marshall Space Flight Center). Apr 1987. 41p. (NASA-TP—2714; NAS—1.60:2714). NTIS, PC A03/MF A01.

A survey of the statistical properties of 850 H alpha solar flares during 1975 is presented. Comparison of the results found here with those reported elsewhere for different epochs is accomplished. Distributions of rise time, decay time, and duration are given, as are the mean, mode, median, and 90th percentile values. Proportions by selected groupings are also determined. For flares in general, mean values for rise time, decay time, and duration are 5.2 + or - 0.4 min, and 18.1 + or 1.1 min, respectively. Subflares, accounting for nearly 90 percent of the flares, had mean values lower than those found for flares of H alpha importance greater than 1, and the differences are statistically significant. Likewise, flares of bright and normal relative brightness have mean values of decay time and duration that are significantly longer than those computed for faint flares, and mass-motion related flares are significantly longer than non-mass-motion related flares. Seventy-three percent of the mass-motion related flares are categorized as being a two-ribbon flare and/or being accompanied by a high-speed dark filament. Slow rise time flares (rise time greater than 5 min) have a mean value for duration that is significantly longer than that computed for fast rise time flares, and long-lived duration flares (duration greater than 18 min) have a mean value for rise time that is significantly longer than that computed for short-lived duration flares, suggesting a positive linear relationship between rise time and duration for flares. Monthly occurrence rates for flares in general and by group are found to be linearly related in a positive sense to monthly sunspot number. Statistical testing reveals the association between sunspot number and numbers of flares to be significant at the 95 percent level of confidence, and the t statistic for slope is significant at greater than 99 percent level of confidence.

38063 **(N—87-21763) Research in planetary studies and operation of the Mauna Kea Observatory. Semiannual progress report, January-December 1986.** Cruikshank, D.P. (Hawaii Univ., Honolulu (USA)). Dec 1986. 92p. (NASA-CR—180513; NAS—1.26:180513; SAPR—32; SAPR—33). NTIS, PC A05/MF A01.

The research programs are highlighted in the following areas: major planets; planetary satellites and rings; asteroids; comets; dark organic matter; theoretical and analytical structures; extrasolar planetary; and telescopes.

38064 **(PB—87-173605/XAB) Procedures for reduction of Fe XII 10747 A coronal emission-line polarization observations. Technical note.** Arnaud, J.; Newkirk, G. (National Center for Atmospheric Research, Boulder, CO (USA)). Jan 1987. 25p. (NCAR-TN—278-STR). NTIS, PC A02/MF A01.

The note documents the reducing procedures used to obtain the best estimates of the coronal Stokes parameters from the raw measurements recorded in two spectral channels with the High Altitude Observatory-Sacramento Peak Observatory Coronal Emission-line Polarimeter (KELP). The original reduction programs were modified to survey the KELP data as a whole and to help determine whether corrections are needed for each scan.

38065 **(PB—87-181194/XAB) Solar-Geophysical Data Number 510, February 1987. Part 1 (prompt reports). Data for January 1987, December 1986, and late data.** Coffey, H.E. (National Geophysical Data Center, Boulder, CO (USA)). Feb 1987. 99p. (SGD—510-PT-1). NTIS, PC A05/MF A01.

See also Part 2, PB—87-181202 and PB—87-162582.

Contents include: Detailed index for 1986-1987; Data for January 1987--(IUWDS alert periods (Advance and worldwide); Solar activity indices, Solar flares, Solar radio emission, Stanford mean solar magnetic field); Data for December 1986--(Solar-active regions, Sudden ionospheric disturbances, Solar radio spectral observations, Cosmic-ray measurements by neutron monitor, Geomagnetic indices, Radio propagation indices); Late data--(Solar radio emission December 1986, Cosmic-ray measurements by neutron monitor, Geomagnetic indices).

38066 **(PB—87-181202/XAB) Solar-Geophysical Data Number 510, February 1987. Part 2 (comprehensive reports). Data for August 1986.** Coffey, H.E. (National Geophysical Data Center, Boulder, CO (USA)). Feb 1987. 45p. (SGD—510-PT-2). NTIS, PC A03/MF A01.

See also Part 1, PB—87-181194 and PB—87-162574.

Contents include: Detailed index for 1986-1987; Data for August 1986--(Meudon carte synoptique, Solar flares, Solar radio bursts at fixed frequencies, Solar x-ray radiation from GOES satellite, Mass ejections from the sun, Active prominences and filaments); Miscellaneous data--Interplanetary solar plasma.

38067 **(PB—87-184198/XAB) Sunspot numbers: 1610-1985 based on The Sunspot-Activity in the Years 1610-1960'.** McKinnon, J.A. (World Data Center A for Solar-Terrestrial Physics, Boulder, CO (USA)). Jan 1987. 115p. (UAG—95). NTIS, PC A06/MF A01.

Library of Congress catalog card No. 75-643290.

Contents include: (1610-1985) Minima and Maxima of Sunspot Number Cycles; (1700-1985) Yearly Mean Sunspot Numbers (Table); (1700-1985) Yearly Mean Sunspot Numbers (Graph); (1749-1985) Monthly Mean Sunspot Numbers (Tables); (1749-1985) Monthly Mean Sunspot Numbers (Graph); (1749-1985) Smoothed Monthly Mean Sunspot Numbers (Tables); (1749-1985) Smoothed Monthly Mean Sunspot Numbers (Graph); (1818-1985) Daily Sunspot Numbers (Tables); (1818-1985) Daily Sunspot Numbers (Graph); and UAG Series of Reports.

38068 **(PB—87-186383/XAB) Solar-Geophysical Data Number 511, March 1987. Part 2 (comprehensive reports). Data for September 1986, and miscellanea.** Coffey, H.E. (National Geophysical Data Center, Boulder, CO (USA)). Mar 1987. 85p. (SGD—511-PT-2). NTIS, PC A05/MF A01.

See also PB—87-162582 and PB—87-186375.

Contents include: Detailed index for 1986-1987; Data for September 1986-- Meudon Carte Synoptique; Solar flares; Solar radio bursts at fixed frequencies; Solar x-ray radiation from GOES satellite; Mass ejections from the sun; Active prominences and filaments; Miscellaneous data-- Interplanetary solar plasma.

38069 (SLAC—312, pp 607-632) **Discovery of very high energy point sources.** Halzen, F. (CERN, Geneva, Switzerland). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

A cosmic accelerator such as Cygnus X-3 has a luminosity of at least one million suns. This observation may resolve the long-standing question of the origin of very high energy cosmic rays. Its flux at Earth is roughly $10^7$ photons $km^{-2}$ $year^{-1}$ with energy 1-$10^5$ TeV. They discuss tagged photon experiments exploring particle structure in this energy range. They show how possible underground muon observation of point sources raises rather than answers questions. They discuss these questions in the context of some recent experimental results.

38070 **(UCRL—96725) The early solar system abundance of $^{244}$Pu as inferred from the St. Severin chondrite.** Hudson, G.B.; Kennedy, B.M.; Podosek, F.A.; Hohenberg, C.M. (Washington Univ., St. Louis, MO (USA). McDonnell Center for the Space Sciences). Mar 1987. Contract W-7405-ENG-48. 37p. (CONF-870396—2). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87010811.

From Lunar and planetary science conference; Houston, TX, USA (16 Mar 1987).

We describe the analysis of Xe released in stepwise heating of neutron-irradiated samples of the St. Severin chondrite. This analysis indicates that at the time of formation of most chondritic meteorites, approximately 4.56 x $10^9$ years ago, the atomic ratio of $^{244}$Pu/$^{238}$U was 0.0068 +- 0.0010 in chondritic meteorites. We believe that this value is more reliable than that inferred from earlier analyses of St. Severin. We feel that this value is currently the best available estimate for the early solar system abundance of $^{244}$Pu. 42 refs., 2 tabs.

38071 **Cosmology with decaying vacuum energy.** Freese, K.; Adams, F.C.; Frieman, J.A.; Mottola, E. (California Univ., Santa Barbara, USA. Inst. for Theoretical Physics; California Univ., Berkeley, USA. Dept. of Physics; California Univ., Berkeley, USA. Dept. of Astronomy; Stanford Linear Accelerator Center, CA, USA; Stanford Univ., CA, USA). *Nuclear Physics [Section] B;* **287**: No. 4, 797-814(15 Jun 1987). Contract AC03-76SF00515.

Motivated by recent attempts to solve the cosmological constant problem, we examine the observational consequences of a vacuum energy which decays in time. In both radiation and matter dominated eras, the ratio of the vacuum to the total energy density of the universe must be small. Although the vacuum cannot provide the 'missing mass' required to close the universe today, its presence earlier in the history of the universe could have important consequences. Element abundances from primordial nucleosynthesis require the ratio x=rho/sub vac//(rho/sub vac/+rho/sub rad/)≦ 0.1 in the radiation epoch; even a nonzero x> or approx. 0.01 at nucleosynthesis, however, can allow the number of neutrino (or equivalent light) species to exceed N/sub $\nu$/>4, a case ruled out in the standard cosmological model. If the vacuum decays into low energy photons, the lack of observed spectral distortions in the microwave background gives tighter bounds, x<4 x 10/sup -4/. In the matter-dominated era, the presence of a vacuum term may allow more time for growth of protogalactic perturbations.

38072 **Possible calorimetric effects at Mercury due to solar wind-magnetosphere interactions.** Baber, D.N.; Borovsky, J.E.; Burns, J.O.; Gisler, G.R.; Zeilik, M. (Los Alamos National Laboratory, Los Alamos, New Mexico). *Journal of Geophysical Research;* **92**: No. A5, 4707-4712(1 May 1987).

As a result of the solar wind interaction with the magnetosphere of Mercury, we expect several effects which may be observable with ground-based and/or near-earth radio and infrared telescopes: (1) there may be direct interaction of the solar wind with the surface of Mercury which could produce measurable heating effects; (2) substormlike magnetotail processes within Mercury's magnetosphere may precipitate particles carrying from 10/sup 10/ to 10/sup 12/ W (or more) of power into narrow latitudinal bands on the cold (approx. <130 K) darkside of Mercury, producing surface-heated "auroral" zones; and (3) the presence of Jovian electrons within the inner Hermean magnetosphere may produce transient, very low frequency synchrotron-emitting radiation belts. Hence remote radio and infrared observations hold substantial promise for providing information about the intrinsic properties of Mercury's magnetic field, about the planetary surface, and about the dynami-

cal interaction of the Hermean magnetosphere with the solar wind at —0.4 AU. Copyright American Geophysical Union 1987.

38073 **EXOSAT observations of double-peaked bursts with radius expansion from 4U/MXB 1820-30.** Haberl, F.; Stella, L.; White, N.E.; Gottwald, M.; Priedhorsky, W.C. (EXOSAT Observatory, Darmstadt, West Germany; ESA, Space Science Dept., Noordwijk, Netherlands; Los Alamos National Lab., NM; Max-Planck-Institut fuer Physik und Astrophysik, Garching, West Germany). *Astrophysical Journal;* **314**: 266-271(Mar 1987).

A detailed analysis is presented of seven X-ray bursts from the X-ray source 4U/MXB 1820-30 in the globular cluster NGC 6624. The bursts were double-peaked, and recurred at almost equal time intervals of 3.2 hr. The persistent flux varied by only 10 percent on time scales of 60 minutes. The ratio of the total persistent energy emitted before a burst to the total energy released by a burst varied between 125 and 155. The inferred blackbody radius for the burst spectra showed large variations, increasing from 10 to 200 km within the first 0.25-1.5 s, accompanied by a decrease in spectral temperature from 1.2 to 0.4 keV. The inferred source radius during burst decay was constant at about 10 km. This radius is interpreted as the size of the neutron star. During the radius expansion phase, the luminosity remained constant at a mean value of 2.5 x 10 to the 38th ergs/s, which is consistent with the helium Eddington limit for a 10 km, 1.4 solar mass neutron star. 30 references.

38074 **X-ray and ultraviolet radiation from accreting white dwarfs. IV. Two-temperature treatment with electron thermal conduction.** Imamura, J.N.; Durisen, R.H.; Lamb, D.Q.; Weast, G.J. (Indiana Univ., Bloomington; Los Alamos National Lab., NM; Illinois Univ., Urbana; Harvard-Smithsonian Center for Astrophysics, Cambridge, MA). *Astrophysical Journal;* **313**: 298-319(Feb 1987).

Results are reported from two-temperature calculations of the structures and X-ray spectra of radiation shocks generated by accretion onto nonmagnetic white dwarfs. The approach was necessitated by the domination of bremsstrahlung in the emission region by Compton cooling. Features of the shock model, which includes steady, spherical infall of fully ionized plasma and dominance of the stand-off shock by collisional processes, are summarized. A maximum hard X-ray temperature of about 50 keV and a maximum hard X-ray luminosity of 2 x 10 to the 36th ergs/sec were obtained. The results prove that the bulk of accretion energy cannot be transported to the star by electron thermal conduction, provided that bremsstrahlung cooling is dominant over cyclotron cooling. 52 references.

38075 **Kinematic tests of exotic flat cosmological models.** Charlton, J.C.; Turner, M.S. (Chicago Univ., IL; NASA/Fermilab Astrophysics Center, Batavia, IL). *Astrophysical Journal;* **313**: 495-504(Feb 1987).

Theoretical prejudice and inflationary models of the very early universe strongly favor the flat, Einstein-de Sitter model of the universe. At present the observational data conflict with this prejudice. This conflict can be resolved by considering flat models of the universe which posses a smooth component of energy density. The kinematics of such models, where the smooth component is relativistic particles, a cosmological term, a network of light strings, or fast-moving, light strings is studied in detail. The observational tests which can be used to discriminate between these models are also discussed. These tests include the magnitude-redshift, lookback time-redshift, angular size-redshift, and comoving volume-redshift diagrams and the growth of density fluctuations. 58 references.

38076 **New estimate of the mixing length and convective overshooting in massive stars.** Cloutman, L.D. (Los Alamos National Lab., NM). *Astrophysical Journal;* **313**: 699-710(Feb 1987).

A new approach to estimating the length scale of turbulent motions in convection zones of stars is presented. It is based on a statistical model of turbulence specialized to the stellar interior. It is predicted that the length scale of turbulence is proportional to the turbulence Mach number and to the geometric mean of the pressure scale height and a length scale associated with variations in the strength of the buoyancy forces. This model is applied to a 15.57 solar mass star, and it predicts strong overshooting in a layer up to several solar masses thick outside the convective core. It produces significant increases in the core hydrogen-burning lifetime and in the luminosity after core hydrogen exhaustion, and it removes the conditions that produce semiconvection. 28 references.

38077 **Gamma-ray constraint on the nature of dark matter.** Silk, J.; Bloemen, H. (California Univ., Berkeley). *Astrophysical Journal;* **313**: L47-L51(Feb 1987).

If even a small component of the Galactic spheroid consists of the weakly interacting majorana fermions that are cold-dark-matter candidate particles for the Galactic halo, there should be a substantial flux of annihilation gamma rays from a source of about 1-deg extent at the Galactic center. COS B observations already constrain the halo cold-dark-matter (CDM) content entrained in the inner spheroid to be less than about 10 percent. A somewhat weaker constraint applies to the CDM believed to be present in the Galactic disk, but still only about 15 percent can be in such particles. Monochromatic line photons of energy 3-10 GeV are also predicted, and future experiments may be capable of improving these limits. Since both theoretical models of galaxy formation in a CDM-dominated universe and mass models for the rotation curve in the inner Galaxy suggest that a substantial fraction of the spheroid component should be nonluminous and incorporate entrained halo CDM, the hypothesis that the halo CDM consists predominantly of weakly interacting fermions such as photinos or heavy majorana mass neutrinos or higgsinos may already be subject to observational test. 30 references.

38078 **Baryon and lepton number violation in astrophysics.** Kolb, E.W. (Fermi National Accelerator Lab., Batavia, IL). pp 969-976 of Weak and electromagnetic interactions in nuclei. Proceedings. Klapdor, H.V. (ed.). Berlin, Germany, F.R.; Springer (1986). (CONF-860741—).

From International symposium on weak and electromagnetic interactions in nuclei; Heidelberg, F.R. Germany (1 Jul 1986).

The cosmological and astrophysical significance of baryon and lepton number violating process is the subject of this talk. The possibility of baryon-number violating processes in the electroweak transition in the early universe is reviewed. The implications of lepton-number violation via Nambu-Goldstone bosons are discussed in detail. 555 figures.

38079 **Weak interaction and the large scale structure of the universe.** Schramm, D.N. (Chicago Univ., IL; Fermi National Accelerator Lab., Batavia, IL). pp 1032-1044 of Weak and electromagnetic interactions in nuclei. Proceedings. Klapdor, H.V. (ed.). Berlin, Germany, F.R.; Springer (1986). (CONF-860741—). Contract FG02-85ER40234.

From International symposium on weak and electromagnetic interactions in nuclei; Heidelberg, F.R. Germany (1 Jul 1986).

The combined problems of large scale structure, the need for non-baryonic dark matter if $\Omega=1$, and the need to make galaxies early in the history of the universe seem to be placing severe constraints on cosmological models. In addition, it is shown that the bulk of the baryonic matter is also dark and must be accounted for as well. The nucleosynthesis arguments are now strongly supported by high energy collider experiments as well as astronomical abundance data. The arguments for dark matter are reviewed and it is shown that observational dynamical arguments and nucleosynthesis are all still consistent at $\Omega$proportional to 0.1. However, the inflation paradigm requires $\Omega=1$, thus, the need for non-baryonic dark matter. A non-zero cosmological constant is argued to be an inappropriate solution. Dark matter candidates fall into two categories, hot (neutrino-like) and cold (axion or massive photino-like). New observations of large scale structure in the universe (voids, foam, and large scale velocity fields) seem to be most easily understood if the dominant matter of the universe is in the form of low mass (9 eV $\leqq$ m/sub $\nu$/ $\leqq$ 35 eV) neutrinos. 555 figures.

**38080 (AD-A—179059/1/XAB) Middle atmosphere density and models. Technical report.** Champion, K. (Air Force Geophysics Lab., Hanscom AFB, MA (USA)). 9 Apr 1987. 9p. (AFGL-TR—87-0116). NTIS, PC A02/MF A01.

The 80 to 130 km altitude region is our old ionosphere - the region of the atmosphere that no one seems to be interested in, and yet the critical region for shuttle entry and atmospheric braking. Comparison between the Air Force reference atmosphere and Shuttle IMU data shows large fluctuations at high latitudes. New data sources are available now, such as the Arecibo and Millstone Hill ionospheric scatter radars.

**38081 (AD-A—179136/7/XAB) Generation of broadband noise in the magnetotail.** Dusenbery, P.B.; Lyons, L.R. (Aerospace Corp., El Segundo, CA (USA). Laboratory Operations). 1 Mar 1987. 29p. (TR—0086(6940-06)-12). NTIS, PC A03/MF A01.

Generation of electrostatic noise in the geomagnetic tail by ion beams was evaluated. A stationary plasma-sheet electron distribution and streaming ion distributions were assumed. Both warm-ion streams, as observed within the plasma-sheet boundary layer, and cold-ion streams, as expected from upward-flowing ionospheric ions, are considered. Warm-ion streams by themselves are found to be stable, whereas a cold-ion stream by itself is unstable to the beam-acoustic model. However, wave growth is increased if both cold and warm streams are simultaneously present. These results suggest that the interaction between the warm- and cold-ion streams is responsible for the peak in electrostatic-wave intensities observed within the plasma-sheet boundary layer. For cold and warm ions streaming in the same direction, wave growth peaks for wave normal angles theta = $O^{o}$ and wave frequencies about 0.1 x the electron plasma frequency were found. However, for anti-parallel streaming cold and warm ions, wave growth peaks near theta approx. = $90^{o}$ and wave frequencies are an order of magnitude smaller. Including counter-streaming warm ions in addition to a cold-ion stream results in wave growth that is a superposition of that for the above two cases.

**38082 (AD-A—179174/8/XAB) Preliminary investigation of ionospheric modifucation using oblique-incidence high-power h-f (high-frequency) radio waves. Technical report.** Sales, G.S.; Reinisch, B.W.; Dozois, C.G. (Lowell Univ., MA (USA). Center for Atmospheric Research). Sep 1986. 44p. (ULRF—435/CAR). NTIS, PC A03/MF A01.

A special experiment was carried out using a high-powered transmitter and a high-gain rhombic antenna to heat the ionosphere at a distance of 1300 km from the transmitter. A Digisonde ionospheric sounder was located at the midpoint to sense any changes that might occur in the ionosphere at the heating cycle period of ten minutes. The measured phase data were processed using spectrum analysis in an attempt to detect this ten-minute period. The results are not conclusive, but there is some indication that the heating period was detected only during the nighttime in agreement with theoretical prediction.

**38083 (AD-A—179184/7/XAB) Magnetosphere-ionosphere interaction studies. Final report, 11 July 1980-30 June 1984.** Doyle, S.M.; Anderson, P.; Basinska-Lewin, E.; Rich, F.; Young, E.R. (Regis Coll., Weston, MA (USA)). 30 Jun 1984. 103p. NTIS, PC A06/MF A01.

The objectives of this contract were twofold: 1) study of the electrodynamics of the ionosphere-magnetosphere system in order to gain new insight about the transmission of energy and particles through the system using data from the S3-2, S3-3 and DMSP satellites; 2) design, test, and evaluate new spacecraft hardware for measuring particles and fields more efficiently and completely. This report summarizes five studies performed in fulfillment of objective 1. The accomplishment of objective 2 has involved the design of instrumentation for several satellite programs and is detailed in Section 2 of the report. The final section describes software developed for preliminary processing of data from the retarding potential analyzer, yielding estimates of typical plasma parameters.

**38084 (AD-A—179224/1/XAB) Correlation between asymptotic directions of cosmic-ray particles and cutoff rigidities in the evolving geomagnetic field.** Flueckiger, E.O.; Smart, D.F.; Shea, M.A.; Gentile, L.C. (Air Force Geophysics Lab., Hanscom AFB, MA (USA)). 1 Mar 1987. 5p. (AFGL-TR—87-0120). NTIS, PC A02/MF A01.

Pub. in J. of Geophysical Research, Vol. 92, No. A3, 2551-2554(1 Mar 1987).

The concept of geomagnetic optics, as described by the asymptotic directions of approach, is extremely useful in the analysis of cosmic radiation data. However, when changes in cutoff rigidities occur as a result of evolution in the geomagnetic field, there are corresponding changes in the asymptotic cones of acceptance. It has been demonstrated that the effect of geomagnetic disturbances on asymptotic directions of approach can be estimated for nonpolar locations from the corresponding change in the cutoff rigidity. In this paper it is shown that the same procedure is applicable with respect to the secular evolution in the geomagnetic field, and that, with this procedure, it is possible to adjust reference published asymptotic directions to other epochs if the change in cutoff rigidity is known.

**38085 (AD-A—179258/9/XAB) Atmospheric radiance profile codes. Technical report.** Yap, B.K. (Utah State Univ., Logan (USA). Center for Space Engineering). 17 Sep 1986. 52p. (CSE—86-120). NTIS, PC A04/MF A01.

This report presents and describes the computer codes developed to generate atmospheric radiance profiles for various molecules, species, and rotational bands. Researchers extracted radiance profiles from the standard NLTE program output files and transferred them from the Cyber system to the Apollo system. Efforts include a routine to plot the radiance profiles sum total and SPIRE program measured data.

**38086 (AD-A—179374/4/XAB) Comparison of ionospheric-model predictions with MITHRAS observations. Scientific report (Final), 14 November 1983-14 November 1986.** Schunk, R.W. (Utah State Univ., Logan (USA). Center for Atmospheric and Space Sciences). 14 Jan 1987. 11p. NTIS, PC A02/MF A01.

MITHRAS is a coordinated multiradar program to study the interactions between the magnetosphere, ionosphere, and thermosphere, as well as the phenomena that result from these interactions. The program is based on a data set acquired by the Chatanika, Millstone Hill, and Eiscat incoherent scatter radars. A large portion of the data is unique in that it was the only time when the radars, well separated in local and magnetic time, simultaneously probed the high latitude ionosphere. The concern was model data comparisons, specifically, the author compared the predictions of his three-dimensional, time-dependent model of the high-latitude ionosphere with MITHRAS data sets. Of particular interest were the variations of the ionosphere with altitude, latitude, longitude, universal time, season, and magnetic activity. Model data comparisons enabled determination of the adequacy of current understanding of high-latitude ionosphere dynamics as well as certain magnetosphere/ionosphere/atmosphere coupling processes.

**38087 (N—87-21427) Retarding potential analyzer research. Semiannual report, 1 July-31 December 1986.** Hanson, W.B. (Texas Univ., Dallas (USA)). Apr 1987. 9p. (NASA-CR—180508; NAS—1.26:180508). NTIS, PC A02/MF A01.

Studies were continued in the areas of ionospheric electrodynamics, plasma irregularities, and ion-neutral coupling. The spectral characteristics of structure in the ion concentration and the electric field at high latitudes were examined. It was found that in the region of velocity shears the relationship between the slopes of the two spectra are dependent on the existence of large field-aligned currents and apparently large ionospheric conductivity gradients. The relationship between the Joule dissipation and the locally measured value of the ion temperature were studied by examining the horizontal ion drift velocity. The importance of ion-neutral coupling was investigated in additional studies involving the nature of the coupling at high latitude boundaries and during times of magnetic disturbances. Much of this behavior can be modeled using

globular circulation models. In order to study the storm time response of the thermosphere the global ion convection pattern was derived from DE-2 measurements and used as input in a circulation model. The calculated variables of neutral velocity and composition and temperature were compared with measurements to validate the technique.

38088 **(AD-A—179066/6/XAB) Relativistic calculations and measurements of energies, Auger rates, and lifetimes. Final report, 15 January 1984-14 January 1985.** Crasemann, B. (Technische Univ. Muenchen (Germany, F.R.). Inst. fuer Angewandte Botanik). 15 Feb 1985. 20p. NTIS, PC A02/MF A01.

Deep atomic-hole states constitute a regime that has only recently become amenable to detailed investigation. The physics of atomic inner shells are peculiar in several respects: (i) Transitions are mostly radiationless, proceed through many channels, and are often very strong; hole state lifetimes thus become as short as attoseconds, with widths measured in tens of electron volts. The dynamics of inner-shell transitions consequently exhibit unusual features. This research program has explored these peculiar properties of energetic inner-shell processes. Attention was paid to relativistic and quantum-electrodynamic effects and large-scale state-of-the-art computations of hole-state energies, and transition rates were made. In the course of this work, the first general computer code for the relativistic calculation of Auger rates was developed.

38089 **(AD-A—179137/5/XAB) Relativistic calculations and measurements of energies, Auger rates, and lifetimes. Final technical report, 15 December 1982-14 January 1987.** Crasemann, B. (Oregon Univ., Eugene (USA). Dept. of Physics). 15 Jan 1987. 12p. NTIS, PC A02/MF A01.

Experimental and theoretical research on atomic inner-shell physics was performed. Relativistic calculations of energy levels and transition rates were performed, including configuration interaction and quantum-electrodynamic effects. Cross sections for inner-shell ionization by slow protons were computed relativistically. The dynamics of inner-shell processes has been studied through experiments with radiation. Based on resonant-scattering theory, a unified theory was developed that describes resonant Raman processes at threshold, post-collision interaction above threshold, and the traditional two-step excitation-deexcitation model in the high-energy limit. A study of multiphoton multiionization in strong laser fields was initiated.

38090 **(AD-A—179154/0/XAB) Low-energy collisions of excited atoms. Final report, 1 May 1984-30 April 1985.** Neynaber, R.H. (La Jolla Inst., CA (USA)). 29 May 1985. 5p. NTIS, PC A02/MF A01.

Alkali-halogen and alkali-alkali systems were studied, including sodium-bromine, Na-chlorine, Na-Na, and Na*-Na. All atoms were in the ground state except Na*, which represents Na in the first electronic state. Merging-beams techniques were used for the former systems and beam-gas for the latter. Laser radiation was employed to generate Na* either in the beam or the gas. Theoretical predictions of cross sections for Na-Br and Na-Cl have been made by Faist and Levine and are in good agreement with these experimental results. Comparisons of cress sections for Na-Na and Na* show that electronic excitation of Na greatly enhances ion-pair production.

38091 **(AD-A—179226/6/XAB) Experimental and theoretical studies of laser cooling and emittance control of neutral beams. Final report, 1 November 1981-31 January 1987.** Lam, J.F.; McFarlane, R.A.; Palmer, A.J.; Steel, D.G.; Turley, R.S. (Hughes Research Labs., Malibu, CA (USA)). 31 Jan 1987. 130p. (HAC-REF-E—9915). NTIS, PC A07/MF A01.

Experimental and theoretical studies are made of issues relevant to laser cooling and emittance control of neutral beams. Experimental accomplishments include development of a technique for state specific velocity selection in atomic beams, observation of the optical Kapitza Dirac Effect, construction of sodium and atomic hydrogen beam facilities, and initial development of a tunable, transform-limited, vacuum-ultraviolet source. Theoretical accomplishments include development of a theory of pi pulse cooling, a theory of two-photon ionization in atomic hydrogen resonant with the Lyman-alpha transition, and an incorporation of the effects of intense fields in the theory of the Optical Kapitza Dirac Effect.

38092 **(AD-A—179390/0/XAB) Frequency-shift measurements of the Q(1) and Q(2) lines of $H_2$ using high-resolution c-w Coherent Anti-Stokes Raman Spectroscopy. Master's thesis, June-October 1986.** Jelonek, M.P. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). 10 Dec 1986. 55p. (AFIT/GEP/ENP—86D-5). NTIS, PC A04/MF A01.

Linear and quadratic frequency shift coefficients were determined for the Q(1) and Q(2) lines of hydrogen using cw Coherent Anti-Stokes Raman Spectroscopy (CARS). The linear coefficients were accurate to three significant digits which is an order of magnitude better than any other published results. The quadratic coefficients were comparable to other reported results because of the range of pressures investigated in this study. Frequency stabilization of the argon-ion laser allowed accurate measurements of the frequency shifts over a range of 2 to 40 atmospheres. A Fabry-Perot interferometer provides a relative-frequency marker and iodine absorption peaks provided an absolute-frequency reference. The coefficients determined were compared to those calculated by other researchers using different experimental methods. The high accuracy of the measurements added further credence to the effectiveness of cw CARS as a high-resolution spectroscopic tool.

38093 **(AD-A—179585/5/XAB) Master-equation approach to collisionally induced absorption and emission.** Alber, G.; Cooper, J. (Colorado Univ., Boulder (USA)). May 1986. 32p. NTIS, PC A03/MF A01.

Pub. in Physical Review A, Vol. 33, No. 5, 3084-3112(May 1986).

The collisionally induced excitation and photon emission of a neutral radiator atom surrounded by a gas of netural foreign perturbers is studied within the binary-collision approximation. An equation of motion is derived for the reduced density matrix of the radiator and the spectrum is obtained of the spontaneously emitted photons includng components due to collisionally induced radiation and to Rayleigh scattering, which is valid in both impact and quasistatic regimes. In the formulation single and subsequent collisional contributions are taken into account, and various coherent and incoherent corrections are examined.

38094 **(CONF-870752—1-Ext.Abst.) The evaporative vector: Homogeneous systems.** Klots, C.E. (Oak Ridge National Lab., TN (USA)). May 1987. Contract AC05-84OR21400. 5p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87009812.

From 11. international symposium on molecular beams; Edinburgh, UK (12 Jul 1987).

Molecular beams of van der Waals molecules are the subject of much current research. Among the methods used to form these beams, three-sputtering, laser ablation, and the sonic nozzle expansion of neat gases - yield what are now recognized to be "warm clusters." They contain enough internal energy to undergo a number of first-order processes, in particular that of evaporation. Because of this evaporation and its attendant cooling, the properties of such clusters are time-dependent. The states of matter which can be arrived at via an evaporative vector on a typical laboratory time-scale are discussed. Topics include the (1) temperatures, (2) metastability, (3) phase transitions, (4) kinetic energies of fragmentation, and (5) the expression of magical properties, all for evaporating homogeneous clusters.

38095 **(GSI—86-55-Prepr.) Multiple positron structures observed from U-U collisions at 5.6 MeV/u and 5.9 MeV/u.** Tsertos, H.; Bosch, F.; Kienle, P.; Koenig, W.; Kozhuharov, C.; Berdermann, E.; Huchler, S.; Wagner, W. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.); Technische Univ. Muenchen, Garching (Germany, F.R.). Fakultaet fuer Physik). Dec 1986. 7p. NTIS, PC E07; Available from NTIS as TIB/B87-04531.

High resolution positron spectroscopy in U-U collisions at bombarding energies of 5.6 MeV/u, the lowest energy studied until now as well as of 5.9 MeV/u, reveals similar multiple structures between 220 keV and 385 keV superimposed on the induced and nuclear continua.

38096 **(LBL—23307) Nonlinear-spectroscopic studies of highly excited states of molecules in supersonic beams.** Page, R.H. (Lawrence Berkeley Lab., CA (USA)). Apr 1987. Contract AC03-76SF00098. 324p. NTIS, PC A14/MF A01; 1; GPO Dep. File Number DE87012093.

The absorption spectrum of water dimers in the O-H stretching region (~3400 to 3800 $cm^{-1}$) was obtained by monitoring vibrational predissociation. The O-H stretching frequencies of the dimer were shifted by hydrogen bonding. In a lower-resolution experiment, $(H_2O)_{19}$ clusters were studied. The effect of the cluster temperature on the absorption spectrum was discussed. Rotationally resolved photoionization spectra of $H_2O$ and $D_2O$ were obtained. Energies of some excited states were accurately determined. Autoionizing Rydberg series in the spectra were identified. XUV-UV and XUV-visible double-resonance experiments on $H_2$ are described. Two infrared-ultraviolet double resonance experiments on benzene were performed. This provided evidence that showed that the C-H stretching admixture contains four states instead of three. A reassignment of the benzene uv spectrum is suggested. A Fermi resonance in the excited state was also detected.

38097 **State-selected study of ion-molecule reactions using tandem molecular beam photoionization mass spectrometry. II. Absolute spin-orbit-state excitation cross sections for the reactions $Ar^+(^2P/sub\ 3/2/) + Ar(^1S_0)$ and $Ar^+(^2P/sub\ 3/2/) + N_2(X,v = 0)$.** Shao, J.D. Ames, IA; Iowa State Univ. (1986). 166p. University Microfilms Order No. 87-03,768.Contract W-7405-ENG-82.

Thesis (Ph. D).

A new ion-molecule reaction apparatus, which consists of a photoionization source, a tandem mass spectrometer, and a radio frequency (rf) octopole reaction cell, is described. Using a quadrupole mass filter to reject $H_3^+$ background ions formed at the photoionization region, absolute total cross sections for the reaction $H_3^+(nu_0') + H_2(nu_0'' = 0) \rightarrow H_3^+ + H$, were measured as a function of the vibrational state of reactant $H_3^+$, where $nu_0' = 0$-4, over the center-of-mass collision energy range of 0.04-15eV. Absolute spin-orbit-state-selected total cross sections for charge transfer reactions $Ar^+(^2P/sub\ 3/2/) + N_2X, v = 0)$ and $Ar^+(^2P/sub\ 1/2/) + N_2 X, v = 0)$, $\sigma/sub\ 3/2/$ and $\sigma/sub\ 1/2/$, respectively, at the E/sub c.m./ range of 0.25-115.3 eV were also measured using the same apparatus. With the triple-quadrupole double-octopole photoionization tandem mass spectrometer, absolute state-selected total cross sections, $\sigma/sub\ v'/,v' = 0$ and 1, for reaction $N_2^+(X, v' = 0,1) + Ar(^1S_0) \rightarrow N_2(X,v) + Ar^+(^2P/sub\ 3/2,1/2/)$ (reaction (1)) over E/sub c.m./ range of 1.2-140 eV were measured.

Supersedes AD—A135-787, dated 1983.

Contents include: numerical and alegbraic; vector identities; differential operations in curvilinear coordinates; dimensional systems (SSI) nomenclature; metric prefixes, physical constants (cgs); formula conversion. Maxwell's equations; electricity and magnetism; electromagnetic frequency/wavelength bands; a-c circuits; dimensionless numbers of fluid mechanics; shocks; fundamental plasma parameters; plasma-dispersion function; collisions and transport; approximate magnitudes in some typical plasmas; ionospheric parameters; solar-physics parameters; thermonumclear fusion; relativistic electron beams; beam instabilities; lasers; atomic physics and radiation.

38099 **(AD-A—179209/2/XAB) Effects of corona on heat transfer in an enclosure. Master's thesis.** Dyer, D.D. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). Dec 1986. 79p. (AFIT/GA/AA—86D-4). NTIS, PC A05/MF A01.

Experiments were conducted to determine the effects of corona wind on heat-transfer rates for enclosures. Tests were performed with an enclosed cavity heated on the bottom and cooled on the top (and vice versa). A corona wind was established inside the cavity by applying high voltages to 0.004-inch-diameter chromel wires placed along the hot and cold surfaces of the cavity. Tests were conducted using both positive voltage potential and negative voltage potential to create the corona discharge. Different wiring configurations were used to establish a variety of flow patterns inside the cavity. The heated-surface heat-transfer rates were calculated for each of the test configurations with and without corona. These heat-transfer rates were determined when the corona discharge was present and compared to the rates found when the discharge was not present. Comparing these transfer rates revealed how much the corona wind augmented the heat-transfer process. Results showed corona wind can increase heat transfer rates inside an enclosure by almost four times the rates attained without the corona discharge for the wire configurations investigated.

38100 **(AD-A—179212/6/XAB) Radial density distribution of negative atomic oxygen in the oxygen positive column: an experiment. Master's thesis.** DelGrande, J.M. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). Dec 1986. 83p. (AFIT/GEP/ENP—86D-3). NTIS, PC A05/MF A01.

This thesis develops the foundation for an experiment to determine the radial distribution of the negative atomic oxygen ion in the positive column of a plasma discharge. Lee's theory is modified to apply to a discharge of square cross section. A new design for a discharge tube is presented. The operating characteristics of this tube are investigated: current-voltage measurements are made showing operating regimes of the T-form and H-form of the discharge, and acoustic waves are shown to exist in the T-form region. Three experimental designs are presented to determine the radial density of the oxygen anion, each involving photodetachment.

A summary of the meeting is given. Included are lists of the invited speakers, special lectures, and the minisymposia. (WRF)

38103 **(LBL—23342) Numerical solution of the Hele-Shaw equations.** Whitaker, N. (Lawrence Berkeley Lab., CA (USA)). Apr 1987. Contract AC03-76SF00098. 115p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE87011211.

An algorithm is presented for approximating the motion of the interface between two immiscible fluids in a Hele-Shaw cell. The interface is represented by a set of volume fractions. We use the Simple Line Interface Calculation method along with the

method of fractional steps to transport the interface. The equation of continuity leads to a Poisson equation for the pressure. The Poisson equation is discretized. Near the interface where the velocity field is discontinuous, the discretization is based on a weak formulation of the continuity equation. Interpolation is used on each side of the interface to increase the accuracy of the algorithm. The weak formulation as well as the interpolation are based on the computed volume fractions. This treatment of the interface is new. The discretized equations are solved by a modified conjugate gradient method. Surface tension is included and the curvature is computed through the use of osculating circles. For perturbations of small amplitude, a surprisingly good agreement is found between the numerical results and linearized perturbation theory. Numerical results are presented for the finite amplitude growth of unstable fingers. 62 refs., 13 figs.

38104 **(UCRL—96763) Numerical solutions for laminar flow over a backward-facing step.** Szymczak, W.G.; Solomon, J.M.; Berger, A.E.; Bell, J.B.; Osborn, J.E. (Naval Surface Weapons Center, Silver Spring, MD (USA); Lawrence Livermore National Lab., CA (USA); Maryland Univ., College Park (USA). Dept. of Mathematics). Jun 1987. Contract W-7405-ENG-48. 10p. (CONF-870677—7). NTIS, PC A02. File Number DE87010782.

From 6. IMACS international symposium on computer methods for partial differential equations; Bethlehem, PA, USA (23 Jun 1987).

In this paper, we present numerical results for steady two-dimensional laminar flow over a rearward facing step. This problem is special in the sense that the use of conservative central differencing of the convective terms does not generate spurious oscillations in the flowfield, even when the cell Reynolds number condition is violated. However, spurious oscillations do appear when considering either the problem of flow over a full step or flow in a smoothly expanding channel. A scheme in which artificial viscosity is added primarily in the flow direction is shown to be more stable than the central difference scheme, without the loss of accuracy associated with certain first order upwind schemes. These computational results are compared to the experimental measurements of Armaly et al., on the rearward facing step problem. The accuracy of these schemes as well as several others appearing in the literature are also tested on two model convection diffusion problems.

38105 **Analytic theory for the linear stability of the Saffman—Taylor finger.** Tanveer, S. (Department of Applied Mathematics, California Institute of Technology, Pasadena, California 91125). *Physics of Fluids;* **30**: No. 8, 2318-2329(Aug 1987).

An analytic theory is presented for the linear stability of the Saffman—Taylor finger in a Hele—Shaw cell. Eigenvalues of the stability operator are determined in the limit of zero surface tension and it is found that all modes for the McLean—Saffman branch of solutions [J. Fluid Mech. 102, 455 (1980)] are neutrally stable, whereas other branches first calculated by Romero (Ph.D. thesis, California Institute of Technology, 1982) and Vanden-Broeck [Phys. Fluids 26, 2033 (1983)] are unstable to arbitrary infinitesimal disturbances. It is also shown that the Saffman—Taylor discrete set of eigenvalues is a special case of a continuous unstable spectrum for zero surface tension. The introduction of any amount of surface tension perturbs the corresponding eigenmodes such that the finger boundary is a nonanalytic curve in general. Only transcendentally small terms in surface tension are responsible for the nonanalyticity of the finger boundary as in the case of Saffman—Taylor steady finger solutions of arbitrary finger width.

38106 **Alignment of vorticity and scalar gradient with strain rate in simulated Navier—Stokes turbulence.** Ashurst, W.T.; Kerstein, A.R.; Kerr, R.M.; Gibson, C.H. (Combustion Research Facility, Sandia National Laboratories, Livermore, California 94550). *Physics of Fluids;* **30**: No. 8, 2343-2353(Aug 1987).

The alignment between vorticity and eigenvectors of the strain-rate tensor in numerical solutions of Navier—Stokes turbulence is studied. Solutions for isotropic flow and homogeneous shear flow from pseudospectral calculations using $128^3$ grid points have been examined. The Taylor Reynolds number is 83 or greater. In both flows there is an increased probability for the vorticity to point in the intermediate strain direction and at three-fourths of the sample points this strain is positive (extensive). This propensity for vorticity alignment with a positive intermediate strain is a consequence of angular momentum conservation, as shown by a restricted Euler model of the coupling between strain and vorticity. Probability distributions for intermediate strain, conditioned on total strain, change from a symmetric triangular form at small strain to an asymmetric one for large strain. The most probable value of the asymmetric distribution gives strains in the ratios of 3:1: -4. The evolution of the distribution from a symmetric to an asymmetric form as the strain magnitude increases is essentially the same in both flows, indicating a generic structure of intense turbulence. The alignment between the gradient of a passive scalar and eigenvectors of the strain-rate tensor for Prandtl numbers of 0.1, 0.2, 0.5, and 1.0 has also been studied. There is an increased probability for the scalar gradient to align in the most compressive strain direction, and the average gradient is larger when it is pointing in that direction. Estimates for the scalar dissipation from the turbulent kinetic energy, its dissipation, and the root-mean-square scalar value are in reasonable agreement with calculated scalar dissipation if no explicit Prandtl number dependence is used in the estimate.

38107 **Modeling the viscous wall region.** Azab, K.A.; McLaughlin, J.B. (Department of Physics, Clarkson University, Potsdam, New York 13676). *Physics of Fluids;* **30**: No. 8, 2362-2373(Aug 1987).

A model is used to study the viscous wall region of turbulent shear flowsover rigid flat surfaces. Periodic boundary conditions are imposed in thehorizontal directions with periodicity lengths that are several times largerthan the experimental streak spacing. In order to sustain the turbulence in theviscous wall region, the averaged x component of the velocity is set equal to a fixed profile outside the viscous wall region. Pseudospectral methods are used to solve the governing equations with the Marcus time splitting scheme. It is shown that a model of the viscous wall region can reproduce much of the behavior seen in direct simulations of turbulence that place greater demands on computer resources. The model is used to investigate the flow of energy in the viscous wall region and the relationship between low-speed streaks and vortices in the viscous wall region.

38108 **Interpretation of the Yakhot—Orszag turbulence theory.** Kraichnan, R.H. (303 Potrillo Drive, Los Alamos, New Mexico 87544). *Physics of Fluids;* **30**: No. 8, 2400-2405(Aug 1987).

Yakhot and Orszag have recently developed a theory of turbulence [J. Sci. Comput. 1, 3 (1986)] based on dynamic renormalization-group (RNG) techniques. They predict parameters of the Kolmogorov inertial range and then successfully use eddy-viscosity formulas from the inertial-range theory in computations of shear flows. In the present paper a critical analysis of the Yakhot—Orszag theory is offered based on comparison with a simple perturbative model. The latter appears to parallel much of the physical and operational content of the lowest order of the Yakhot—Orszag theory, without using RNG methods. The essence is as follows: (1) the dynamics of modes in the inertial and dissipation ranges are assumed to be dominated by interactions more-or-less local in wavenumber that are modeled by a white-noise force acting against an effective viscosity; and (2) the effective viscosity is estimated by extrapolation from the small contributions of interactions very nonlocal in wavenumber (distant interactions). In common with the Yakhot—Orszag theory, the only explicit contacts with the Navier—Stokes equation are overall energy conservation by nonlinear terms and the interaction coefficients of highly nonlocal wave vector triads.

38109 **(SLAC—312, pp 285-308) Aspects of computing in high energy physics.** Kunz, P.F. (Stanford Univ., CA). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

A variety of network services are being provided for High Energy Physics with a variety of network protocols. This diversity reflects the diversity of opinion of what are the most important perceived needs. This diversity is also influenced by the style of computing for a particular collaboration. For example, a collaboration based on centralized computing, typically the mainframe computer at the national laboratory, puts emphasis on remote logon and remote printing, while one that is based on distributed computing puts emphasis on file transfer and process to process communications. In both styles and for communications outside the collaboration, electronic mail and file transfer are important. The major networks in use by HEP are BITNET, PHYSNET, X.15 based networks, Data switches/terminal multiplexors, and MFENET. Note that there is very little development of networking software or hardware being done by HEP. All of the above are implemented with off-the-shelf items that can be bought from various vendors or available from other sources.

## 6451 Particle Interactions And Properties - Experimental

38110 **(ANL-HEP-CP—87-31) Recent results on polarizations and the present status of the Fermilab polarized beams.** Yokosawa, Akihiko. (Argonne National Lab., IL (USA)). 1986. Contract W-31109-ENG-38. 21p. (CONF-8609296—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011405.

From Workshop on spin phenomena in hadronic interactions; Wuppertal, F.R. Germany (15 Sep 1986).

Experimental results are reviewed on polarization phenomena in nucleon-nucleon scattering at intermediate energies. The present status of S = 0 dibaryon resonances is presented. The status of the Fermilab polarized beam program is presented, including the construction of polarized beam, two polarimeters being installed in the experimental hall, and the experimental program. (LEW)

38111 **(ANL-HEP-CP—87-49) Evidence for the decay tau$^-$ → $\pi^-$eta nu/sub tau/.** Repond, J. (Argonne National Lab., IL (USA)). 1987. Contract W-31109-ENG-38. 15p. (CONF-870278—4). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011541.

From 4. family of quarks and leptons international symposium; Santa Monica, CA, USA (26 Feb 1987).

The inclusive production of eta mesons in tau lepton decay has been studied using the High Resolution Spectrometer at the PEP $e^+e^-$ facility. The data sample corresponds to an integrated luminosity of 300 $pb^{-1}$ and the storage ring was operated at $\sqrt{s}$ = 29 GeV. The eta production appears to be only compatible with the decay tau$^-$ → $\pi^-$eta nu, which violates isospin and G-parity conservation. The branching ratio of 5.1 +- 1.5% explains much of the current discrepancy between the one-prong topological branching ratio and the sum of the individual one-prong modes. Various checks to test the validity of the signal are described.

38112 **(BNL—39657) Electroweak radiative corrections and neutral current phenomenology.** Marciano, W.J. (Brookhaven National Lab., Upton, NY (USA)). Mar 1987. Contract AC02-76CH00016. 11p. (CONF-870121—8). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010050.

From Meeting of the Division of Particles and Fields of the American Physical Society; Salt Lake City, UT, USA (14 Jan 1987).

Precision measurements of sin$^2$ θ/sub W/ including the effects of radiative corrections are surveyed. A world average sin$^2$ θ/sub W/ = 0.231 +- 0.004 is obtained. Comparison of deep-inelastic nu/sub μ/N scattering and m/sub W/ or m/sub Z/ is shown to test the standard model at the quantum loop level and constrain new physics. Implications for extra Z' bosons and grand unified theories are briefly discussed. 25 refs., 2 figs.

38113 **(BNL—39661) Review of the Brookhaven neutrino workshop.** Murtagh, M.J. (Brookhaven National Lab., Upton, NY (USA)). 1987. Contract AC02-76CH00016. 32p. (CONF-870279—9). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87010071.

From Lake Louise winter institute; Alberta, Canada (15 Feb 1987).

Recent experimental results on searches at accelerators for nu/sub μ/ → nu/sub e/ oscillations presented at the Brookhaven National Laboratory Neutrino Workshop are reviewed and prospects for extending these searches are discussed.

38114 **(BNL—39663) ν/sub μ/e → ν/sub μ/e and ν/sub μ/p → ν/sub μ/p.** Suzuki, Y. (Brookhaven National Lab., Upton, NY (USA); Osaka Univ. (Japan)). 1986. Contract AC02-76CH00016. 12p. (CONF-8606201—7). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010042.

From Neutrino '86; Sendai, Japan (3 Jun 1986).

Recent results on the neutrino electron and the neutrino proton elastic scattering from Exp. 734 at BNL are presented. The values of the sin$^2$Θ/sub w/ from the measurements are in good agreement.

38115 **(BNL—39665) Elastic scattering of muon neutrinos at BNL.** Abe, K.; Ahrens, L.A.; Amako, K.; Aronson, S.H.; Beier, E.W.; Callas, J.L.; Cutts, D.; Diwan, M.; Durkin, L.S.; Gibbard, B.G. (Brookhaven National Lab., Upton, NY (USA); Brown Univ., Providence, RI (USA). Dept. of Physics; Hiroshima Univ. (Japan). Dept. of Physics; National Lab. for High Energy Physics, Oho, Ibaraki (Japan); Osaka Univ., Toyonaka (Japan). Dept. of Physics; Pennsylvania Univ., Philadelphia (USA). Dept. of Physics). Feb 1987. Contract AC02-76CH00016. 8p. (BNL—39662; CONF-870283—7; CONF-870121—9). NTIS, PC A02/MF A01; GPO Dep. File Number DE87010069.

From BNL neutrino workshop; Upton, NY, USA (5 Feb 1987).

In this paper measurement of the purely leptonic reactions: nu/sub μ/e → nu/sub μ/e and anti nu/sub μ/e → anti nu/sub μ/e, and the semileptonic reactions: nu/sub μ/p → nu/sub μ/p and anti nu/sub μ/p → anti nu/sub μ/p are presented and discussed in terms of the standard model. The data also places limites of interest on the magnitudes of a possible neutrino charge radius and a neutrino magnetic moment.

38116 **(DESY—86-012) Excited lepton search.** Behrend, H.J.; Buerger, J.; Criegee, L.; Fenner, H.; Field, J.H.; Franke, G.; Fuster, J.; Holler, Y.; Meyer, J.; Schroeder, V. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.); Glasgow Univ. (UK); Hamburg Univ. (Germany, F.R.). 2. Inst. fuer Experimentalphysik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.); Karlsruhe Univ. (T.H.) (Germany, F.R.); Max-Planck-Institut fuer Physik und Astrophysik, Muenchen (Germany, F.R.)). Feb 1986. 21p. (LAL—85/50). NTIS, PC E07; Available from NTIS as TIB/B87-06444.

Using the CELLO detector at PETRA we have searched for excited leptons by studying e/sup +/e/sup -/ interactions which yield p/sup +/p/sup -/γγ, l/sup +/l/sup -/γ and γγ final states, where l = 3, μ or tau. We observe good agreement with QED and set new limits on e*, μ*, and tau* production.

38117 **(DESY—86-023) Radiative tau pair production and search for new particles decaying into tau.** Bartel, W.; Becker, L.; Felst, R.; Haidt, D.; Knies, G.; Krehbiel, H.; Laurikainen, P.; Magnussen, N.; Meinke, R.; Naroska, B. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.); Hamburg Univ. (Germany, F.R.). 2. Inst. fuer Experimentalphysik; Heidelberg Univ. (Germany, F.R.). Physikalisches Inst.; Lancaster Univ. (UK); Manchester Univ. (UK); Maryland Univ., College Park (USA)). Feb 1986. 17p. NTIS, PC E07; Available from NTIS as TIB/B87-06441.

A study of radiative tau pair production, e/sup +/e/sup -/ -> tau/sup +/tau/sup -/γ and e/sup +/e/sup -/ -> tau/sup +/

tau/sup -/$\gamma\gamma$, is presented. The observed events agree with QED predictions of order $\alpha$/sup 3/ and $\alpha$/sup 4/. Excited tau's have been searched for and lower limits on single and pair production are obtained. For QED-like coupling the tau* mass is limited to values greater than 40 GeV (95% CL). A search for unstable charged scalars (S/sup +-/) decaying into tau, e.g. charged Higgs, technipions or the supersymmetric partners of tau's, yields no evidence for such particles. Assuming a branching fraction of B(S -> tau$\nu$) = 1, S masses up to 18.7 GeV are excluded with 95% CL.

38118 **(DOE/ER/03130—35) A research program in experimental high energy physics: Task C, Progress report for contract period January 1, 1987 to December 31, 1987.** Lanou, R.E. Jr.; Cutts, D. (Brown Univ., Providence, RI (USA). Dept. of Physics). 1 Jul 1987. Contract AC02-76ER03130. 90p. (COO—3130TC-35). NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87012066.

An experimental program in strong and electro-weak interaction physics of elementary particles is being carried out using electronic detection techniques. Experiments have been performed at Brown, Brookhaven, Fermilab and SLAC. The work described in this report by the Electronic Detector Group addresses the following: (1) electroweak parameters via neutrino interactions, (2) preparations for experiments ("D-ZERO") at the FNAL 2 TeV anti pp Collider, (3) neutrino properties, and (4) study of the charm system.

38119 **(DOE/ER/03130—262) Inclusive charged and neutral pion photoproduction at 20 GeV.** Rickman O'Dell, V. (Brown Univ., Providence, RI (USA). Dept. of Physics). May 1987. Contract AC02-76ER03130. 180p. (COO—3130TB-262). NTIS, PC A09/MF A01; 1; GPO Dep. File Number DE87011621.

The inclusive charged and neutral pion distributions from the interactions of 20 GeV photons on protons have been measured. The assumptions and analysis done to obtain these distributions are described, and the pion distributions are found to agree with general predictions of the quark-parton model. The quark-quark fusion model and the recombination model were compared to the inclusive pion distributions assuming the photon could be approximated by a superposition of rho and omega vector meson states - an assumption prompted by the Vector Meson Dominance Model of photon structure. Quark models applied to the difference in the charged pion cross sections are examined. The inclusive charge structure of the photoproduced charged pions and that of electroproduced and hadroproduced charged pions were compared. (LEW)

38120 **(DOE/ER/03130—264) A research program in experimental high energy physics: Task B, Progress report for contract period January 1, 1987 to December 31, 1987.** Widgoff, M. (Brown Univ., Providence, RI (USA). Dept. of Physics). 1 Jul 1987. Contract AC02-76ER03130. 77p. (COO—3130TB-264). NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87012065.

The group at Brown has joined a collaboration to carry out experiments in high energy physics using astrophysical sources, in the new underground laboratory being prepared at Gran Sasso. We are building a detector (LVD) which includes a large volume of liquid scintillator together with a multilayered omnidirectional tracking system of high spatial and angular resolution, in order to study particle physics in a domain beyond the range of accelerators now or soon to be available. Among the physics questions we will be able to address very effectively are neutrino oscillations, discrete sources of high energy radiation including muons and neutrinos, dark matter and exotic particles, neutrinos from stellar collapse, and monopoles. During the past year, analysis has continued on the data of SLAC experiments BC72/73/75, studying the interactions in hydrogen of 20 GeV polarized photons. Inclusive $\gamma$p interactions are being studied in detail in this high statistics sample. The hybrid detector built by the Tau Neutrino Collaboration, with the Tohoku one-meter holographic freon bubble chamber as target, has a successful first run at the Tevatron (E745), and data obtained on muon neutrino interactions at high energies are being analyzed. The system has been upgraded for a second run in the Tevatron muon neutrino beam during the summer and fall of 1987. Meanwhile, analysis of data on some aspects of interactions of hadrons with protons and heavier nuclei is continuing (Fermilab E565, E570, E299, E154). Monte Carlo studies of various calorimeter designs have been carried out, with a view to finding ways to employ absorber materials other than uranium effectively, by making use of a software technique to substitute for the compensating effect of uranium. The technique has been found to be useful in improving the energy resolution obtainable with Pb or Cu absorbers.

38121 **(DOE/ER/05096—26) High energy physics: Progress report.** Phillips, G.C.; Roberts, J.B. Jr.; Bonner, B.E. (Rice Univ., Houston, TX (USA). Bonner Nuclear Labs.). 31 May 1987. Contract AS05-76ER05096. 67p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87011207.

Analysis of data on collision of protons with targets of He, Be, C, Al, Sn, and Pb continued. A jet signal has been clearly observed from all nuclei. A collaboration has been formed for carrying out an experiment studying the photoproduced jets from nuclei and propagation of quarks and gluons through nuclear matter. The production of lambda hyperons was studied using the primary polarized beam at BNL/AGS at 13.3 and 18.5 GeV/c. The effect of the proton beam polarization on the lambda production, A/sub N/ and spin transfer have been measured. A request was approved for additional polarized proton beam at the AGS to continue measurements of the spin transfer to hyperons. Progress is reported on an initial 200 GeV/c polarized beam-polarized target experiment. A collaborative experiment was approved for the saearch for exotic/hybrid mesons. Investigations in quantum field theories, especially quantum chromodynamics, were contined. (LEW)

38122 **(DOE/ER/10699—T6) Experimental high energy physics using electromagnetic energy calorimetry: [Progress report].** Marx, M.D. (State Univ. of New York, Stony Brook (USA). Research Foundation). [1987]. Contract AC02-80ER10699. 60p. NTIS, PC A04. File Number DE87011868.

Progress is reported on two areas of contribution to the DO project - construction of the central drift chamber and its electronics and test facilities, and development of the central and end cap modules, test beam program, and software development for the calorimetry. Work is also reported in the area of neutrino physics, in which an experiment has measured cross sections for neutral current processes which are used to determine the Weinberg angle, as well as the axial-vector dipole mass of the proton. Limits were also placed on the electromagnetic properties of the muon neutrino, namely its charge radius and magnetic moment. Limits have also been placed on neutrino oscillations and couplings to heavy neutrinos. (LEW)

38123 **(DOE/ER/40107—T3) Experimental investigations of production of glueballs and meson resonant states.** Lindenbaum, S.J. (City Coll., New York (USA); City Univ. of New York, NY (USA). Research Foundation). 1987. Contract AC02-83ER40107. 35p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87010794.

The major efforts reported have been directed toward investigating glueballs and non-strange mesons. The g/sub T/(2050), g/sub T'/(2300), and g/sub T"/(2350) have been observed in the OZI forbidden reaction $\pi^- p \rightarrow$ phi phi n. Their characteristics are explained within the context of quantum chromodynamics as being produced by 1 to 3 primary glueballs. It is proposed to increase the present statistics in order to reduce the effective partial wave analysis resolution, and to begin to study the high vertical bar t' vertical bar region. It is further planned to pursue coupled channel analysis of high precision $\pi^- p \rightarrow$ K/sub s/$^0$K/sub s/$^0$n data and other relevant world data in the $2^{++}$, $0^{++}$, and $4^{++}$ channels. A program is planned to investigate $K^- p$ and p anti p interactions at 8 GeV/c. (LEW)

**38124 (DOE/ER/40150—25) Spin degrees of freedom in electron nucleon scattering in the resonance region.** Burkert, V.D. (Continuous Electron Beam Accelerator Facility, Newport News, VA (USA)). 1987. Contract AC05-84ER40150. 8p. (CEBAF-PR—87-006; CONF-870165—3). NTIS, PC A02. File Number DE87008667.

From Workshop on electronuclear physics with internal targets; Stanford, CA, USA (5 Jan 1987).

Some aspects of using polarized electrons and/or polarized targets in electron-nucleon scattering experiments are discussed. Polarization measurements can be used to extend the knowledge of nucleon form-factor measurements to higher $Q^2$ and are indispensable for a model-independent extraction of the helicity amplitudes of exclusive meson production. Measurements of polarization asymmetries may also help in revealing the excitation of weaker resonances.

**38125 (FNAL/C—87/71) Study of charm production mechanisms at the Fermilab Tagged Photon Spectrometer: γBe yields D anti D x and γA yields psi x.** Nash, T. (Fermi National Accelerator Lab., Batavia, IL (USA)). Mar 1987. Contract AC02-76CH03000. 9p. (CONF-870339—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010082.

From Moriond meeting on hadrons, quarks and gluons; Les Arcs, France (15 Mar 1987).

This paper describes recent work on charm photoproduction mechanisms based on data from Experiment 691 at the Fermilab Tagged Photon Spectrometer. Preliminary results on open charm production in the energy range 80 to 190 GeV are reported based on a preliminary analysis of 3000 charm events, comprising 30% of the data sample. These results include fits to P perpendicular and X/sub F/ distributions, a measurement of the total charm production cross section on Be and its increase with energy from 100 to 200 GeV, as well as a measurement of the relative fraction of anti D, D, and D* production. Also reported is data based on a special closed geometry run to study the A dependence of psi photoproduction. For the first time in a single experiment, relative cross sections on H, Be, Fe and Pb for both the coherent and incoherent components of the signal have been measured with reduced systematic errors and these results are reported here.

**38126 (FNAL/C—87/82) Experimental results on heavy flavour hadro- and photo-production.** Purohit, M.V. (Fermi National Accelerator Lab., Batavia, IL (USA)). May 1987. Contract AC02-76CH03000. 12p. (CONF-870334—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011067.

From Workshop on results and perspectives in particle physics; La Thuile, Italy (1 Mar 1987).

Results from experiments on the production of beauty and charm with hadron and photon beams are reviewed. Beauty production experiments are beginning to obtain b anti b cross-sections with hadron beams. Hadroproduction of charm is a somewhat more mature field, although high statistics are still eagerly sought. The situation is most promising with charm photoproduction experiments where total cross-sections, p/sub T/$^2$ and X/sub F/ distributions and other production characteristics are now known in considerable detail.

**38127 (SLAC—312, pp 33-48) CP and other experimental probes of electroweak phenomena.** Winstein, B. (Stanford Univ., CA). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

In these lectures some topics where probes of electroweak phenomena are likely either to confirm the Standard Model or point to phenomena which lie beyond it are treated. The current status on the measurement of important parameters of the model, limits on the existence of other phenomena beyond it, and the important measurements of the charged current couplings are discussed. A more extensive treatment of CP nonconservation in the $K^0$ system and the prospects for improvement there are given. The signatures for CP nonconservation in the heavy quark systems will be discussed. Finally, the various searches for phenomena beyond the Standard Model in the study of rare or forbidden decays, particularly of the K meson are reviewed.

**38128 (SLAC—312, pp 49-52) Bound on the number of neutrinos from $e^+e^- \rightarrow \gamma$ upsilon anti upsilon at PEP and PETRA.** Lavine, T.L. (Univ. of Wisconsin, Madison). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

Searches for single unaccompanied photons in $e^+e^-$ collisions at PEP and PETRA are combined. The upper limit on the single-photon process $e^+e^- \rightarrow \gamma$ upsilon anti upsilon is used to obtain a bound on the number of light-neutrinos.

**38129 (SLAC—312, pp 191-222) Phenomenology of heavy quark systems.** Gilman, F.J. (Stanford Univ., CA). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

A brief and incomplete review of the spectroscopy of heavy quark systems is given. A good qualitative picture of the nature of the spin-independent forces exists. That, plus some phenomenological potentials inspired by fundamental theory, carry us a long way. For the spin-dependent effects there is even a semi-quantitative understanding, as they are more sensitive to the short distance part of the potential and there is more insight and more tools to help sort things out. Eventually, a quantitative calculation of both the spin-independent potential $V(\gamma)$ and the spin-dependent potentials $V_2(\gamma)$, $V_3(\gamma)$, and $V_4(\gamma)$, is sought from QCD. This will likely come in due time from improvements in computer power and in technique over the present lattice calculations. In the meantime, to clarify the emerging picture, more data is needed on: the $^1P_1$ states of charmonium and bottomonium, the eta b, the other D/sup **,/s, and the spectrum of toponium.

**38130 (SLAC—312, pp 239-284) Heavy quark spectroscopy and decay.** Schindler, R.H. (Stanford Univ., CA). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

The extensive exclusive measurements of $D^0$ and $D^+$ mesons provide a reasonably firm basis for understanding the charm meson width. The decays of $D^0$ and $D^+$ appear to have a large quasi two-body component. There is evidence for color-suppressed decays, decays in which interference is occurring, and decays where flavor-annihilation appears to be present. Studies of the semileptonic decays point to hadronic matrix elements that are relatively simple, being dominated by form factors that are well modelled by simple poles. Detailed information on the D/sub s/, meson is still lacking. The latter would provide the most direct means of checking the current ideas on interference, flavor-annihilation and the apparent dominance of quasi two-body decays of charm. An alternative is to measure the factors that make up the theoretical estimate of the rate for each of these processes. While D/sub s/ → tau nu should provide an experimentally accessible measurement of the weak decay constant f/sub D./, stringent limits on f/sub D/ from D → μ nu already provide information on the size of perturbative effects that may allow flavor-annihilation to proceed at a measurable rate. The decays of light B mesons (B/sub u/ and B/sub d/) appears to be dominated as expected by the b → c transition. The determination of the b → u fraction has been clouded both by theoretical uncertainties and by experimental difficulty. The lack of a global picture for B hadronic decay has also been hampered by the lack of data on exclusive channels. Inclusive studies of B → D/sub s/, PSI, and D project a spectator-like picture. The smallness of the semileptonic branching ratio however leads one to believe that the nonleptonic sector of B decay may yet hold some surprises. The key to understanding B decay will be in the ability to separate the species B/sub u/ and B/sub d/ and to systematically study the exclusive decays.

**38131 (SLAC—312, pp 361-386) Recent results from the UA1 experiment at CERN.** Dobrzynski, L. (College de France, Paris). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

Results based on a sample of events with large missing transverse energy corresponding to 715 $nb^{-1}$ of data from the UA1 experiment at the CERN anti pp Collider are presented. High transverse momentum tau-leptons from W decays are observed for the first time through their semi-hadronic decay modes. The first direct tests of the e - $\mu$ - tau universality of the weak charged couplings at $Q^2$ = M/sub w/$^2$ is provided. Measured W and $Z^0$ rates and heavy flavor cross sections are used to predict rates of missing transverse energy events from all known Standard Model processes, and thereby to place limits on possible new sources. After taking into account all known sources of missing energy events, they find a mass limit on a fourth generation charged lepton of m/sub L/ > 41 GeV/$c^2$ (90% C.L.) and a limit on the number of additional neutrinos of N/sub $\nu$/ < 7 (90% C.L.). Lower limits for supersymmetric particles, namely 60 GeV/$c^2$ for the gluino and 70 GeV/$c^2$ for the squark (90% C.L.) are also given. Finally, two events are presented in which two energetic hadronic jets and a high energy lepton are balanced by missing energy. These events are discussed and compared to all observed W + 2-jet events.

38132 (SLAC—312, pp 387-414) **Latest results from the UA2 experiment.** Plothow-Besch, H. Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

A study has been made of the decays W → ev and Z → $e^+e^-$, using the UA2 detector at the CERN anti pp Collider. The data correspond to an integrated luminosity of 142 $nb^{-1}$ at a center of mass collision energy $\sqrt{s}$ = 546 GeV, and 768 $nb^{-1}$ at $\sqrt{s}$ = 630 GeV. Measurements of the Standard Model parameters from samples of 251 W decay and 39 Z decay candidates are compared with expectations of the Standard Electroweak Model. Jet cross sections are presented and compared with the predictions of QCD and with data at lower energies. An exclusive sample of three-jet events is analyzed and compared with a phase-space model and with QCD. The strong coupling constant a/sub s/ s measured. An exclusive four-jet data sample is used to test perturbative QCD to order a/sub $s^4$ and to search for the existence of collisions in which more than one hard scattering among partons takes place. A status report is given on the search for the decay of the Intermediate Vector Bosons W and Z into a quark-antiquark pair.

38133 (SLAC—312, pp 415-430) **Results on theta/sub w/ from the CERN high-energy neutrino experiments or: why theta/sub w/? How theta/sub w/?.** Barbiellini, G. (CERN, Geneva, Switzerland). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

Neutrino-nucleon experiments performed with the CDHS and the CHARM detectors at the CERN SPS are reported. The experimental setup is discussed and data presented. Extraction of the Weinberg angle is from the data is discussed and compared to other methods of calculation.

38134 (SLAC—312, pp 431-454) **Physics from PEP.** Ford, W.T. (Univ. of Colorado, Boulder). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—). Contract AC02-86ER40253.

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

Recent results from PEP experiments are reviewed. Included are searches for SUSY particles and measurement of the number of neutrino flavors, two-photon production of resonances pertinent to glueball spectroscopy, tau lepton decays, QCD and electroweak tests, and heavy quark lifetimes.

38135 (SLAC—312, pp 455-474) **Results from PETRA.** Barlow, R. (Manchester Univ., England). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

A review of results from several PETRA experiments performed over the past year is presented. Results cover electroweak asymmetries, low thrust events with isolated muons, lifetime measurements for D, F and B mesons, charm production and QCD related studies. Inclusive muon production and heavy quark fragmentation are also discussed.

38136 (SLAC—312, pp 475-494) **Recent results from ARGUS.** Yoon, T. (Univ. of Toronto, Ontario). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

The ARGUS experiment, running at the DORIS II storage ring, has been collecting data on e+e- collisions near 10 GeV region since the end of 1982. The ARGUS detector, designed specifically for large acceptance and high resolution spectroscopy in the UPSILON resonances region, has produced a prolific amount of new results in recent months. Some of these are presented here. The subject matters include topics from charm and beauty spectroscopy and weak decays of charm mesons, beauty mesons and the tauon.

38137 (SLAC—312, pp 507-524) **Recent results on upsilon physics from CUSB-II.** Tuts, P.M. (Columbia Univ., New York, NY). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

New results on Upsilon(3S) spectroscopy and new particle searches have been obtained using CUSB-II, a high resolution bismuth germanate electromagnetic spectrometer. No evidence is seen for long lived axions, light neutral Higg's, or gluinos in radiative Upsilon decays. Confidence level upper limits on their branching ratios are presented, together with the excluded gluino mass range. The branching fraction of the Upsilon(3S) into muons, B/sub $\mu\mu$/(3S), was measured to be (1.53 +/- 0.29 +/- 0.21)%, the Upsilon(3S) total width to be 25.5 +/- 5.0 keV, $\alpha$/sub s/ = 0.17 +/- 0.014 and $\Lambda$/sub MS/ = 148 +/- 50 MeV. By observing the Upsilon(3S) → chi/sub b/(2P) $\gamma$ → (Upsilon(2S), Upsilon(2S))$\gamma\gamma$ → ell ell $\gamma\gamma$ decay chain they resolved completely the J=2 and J=1 chi/sub b/(2P) states. They obtain product ratios for the decay chains and derive the hadronic widths of the chi/sub b/(2P) states. They also resolved the J=O state in the inclusive photon spectrum and measured the fine structure of the chi/sub b/(2P) state.

38138 (SLAC—312, pp 525-536) **Recent results from the crystal ball experiment.** Lowe, S.T. (Stanford Univ., CA). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

This report reviews several recent analyses from the Crystal Ball collaboration. The major topics discussed are the search for new states in radiative Upsilon(1S) decays, the search for lepton number-violating and inclusive eta decay modes of the tau, and results from $\gamma\gamma$ physics.

38139 (SLAC—312, pp 537-568) **J/psi spectroscopy from MARK III.** Mallik, U. (Stanford Univ., CA). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

The MARK III detector at the SPEAR $e^+e^-$ storage ring at SLAC has accumulated a data sample of 5.8 x $10^6$ J/psi produced. The status of the zeta(2230) observed in the radiative J/psi decay is described. The status of the glueball candidates eta(1440) (iota(1440)) and $f_2$(1720) (theta(1720)) are probed with a systematic comparison between the radiative and the hadronic decays of J/psi. Finally, an understanding of quark correlations is attempted from a systematic study of the J/psi decaying into Vector-Pseudoscalar, Vector-Tensor and Vector-Scalar nonets.

38140 (SLAC—312, pp 569-596) **New results on mesons containing strange quarks.** Ratcliff, B.N. (Stanford Univ., CA). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

Recent results on strange and strangeonium mesons are presented. The data come from a high sensitivity study (4.1 ev/nb) of $K^-$ p interactions at 11 GeV/c using the LASS spectrometer at SLAC. The complete leading orbitally-excited K* series up through J/sup P/ = $5^-$ and a substantial number of the expected underlying states are observed decaying into $K^- \pi^+$, anti K°/sub s/ $\pi^+\pi^-$, and K eta final states, and new measurements are made of their masses, widths, and branching ratios. Production of strangeonium states via hypercharge exchange is observed into K/sub s/°K/sub s/°, $K^-K^+$, and K/sub s/°K/sup +/-/ $\pi$/sup +/-/ final states. The leading orbitally-excited phi series through J/sup P/ = $3^-$ is clearly seen and evidence is presented for additional high spin structure in the 2.2 GeV/c² region. No $f_2$(1720) is observed. The K/sub s/°K/sup +/-/$\pi$/sup +/-/ spectrum is dominated by $1^+$(K* anti K + anti K* K) production in the region below 1.6 GeV/c². These results are compared with data on the same systems produced by different production mechanisms.

38141 (SLAC—312, pp 597-606) **Charm hadroproduction in pp interactions at 400 GeV/c and 800 GeV/c.** Touboul, M.C. (CERN, Geneva, Switzerland). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

Results for D meson production at two different facilities are presented and compared. Experiment NA27 was performed by exposing LEBC with the EHS to the 400 GeV/c proton beam at CERN SPS. Experiment E743 was done with the 800 GeV/c proton beam at Fermilab also using LEBC with the Fermilab Multiparticle Spectrometer. Differential cross sections for D production as a function of various parameters are presented and compared to predictions of the QCD fusion model.

38142 (SLAC—312, pp 633-642) **Recent axion searches.** Bjorken, J.D. (Fermi National Accelerator Lab., Batavia, IL). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

The properties of axions are briefly reviewed and the basic experimental method used to search for them is outlined. The method involves the observation of electron bremsstrahlung or Primakoff radiation in beam dumps. Several recent experiments at Fermilab, KEK, SLAC and Orsay are reviewed and limiting values for axion lifetime and mass are given.

38143 (SLAC—312, pp 667-674) **CP violation in K-short decay.** Thomson, G.B. (Rutgers, The State Univ. of New Jersey, Piscataway). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

The authors are performing an experiment at Fermilab (E621) to measure n/sub +-O/, the parameter describing CP violation in the decay K/sub s/° $\rightarrow \pi^+\pi^-\pi^0$. By collecting $\pi^+\pi^-\pi^0$ decays in a short neutral beam, they search for CP violation in the interference between K/sub S/° and K/sub L/° decays. They took data with the kaon beams produced from two targets, separated by 3 K/sub S/° lifetimes for the average momentum kaon. By comparing the proper time dependence of the data from the two targets they are able to extract an upper limit on eta/sub +-O that is independent of the acceptance of their detector. That upper limit is: absolute value of eta/sub +-O = .022 +/- .026, arg(eta/sub +-O/) = 39° +/- 80°, based on 86,000 events. They have collected an additional 3,200,000 events in a later run, which they are now analyzing, and they expect ultimately to achieve a sensitivity of $\sigma$ absolute value eta/sub +-O/ = .003.

38144 (SLAC—312, pp 675-686) **CERN neutral kaon CP violation experiment NA31.** Cundy, D.C. (European Organization for Nuclear Research, Geneva, Switzerland). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

An experiment to measure the CP violation parameter from decays in the neutral kaon system which is underway at CERN SPS is described. Methods for improving sensitivity and precision and correcting for background radiation are emphasized. Preliminary results from a separate experiment to measure neutral kaon radiative decay are also presented.

38145 (SLAC-PUB—3928) **Future frontiers for $e^+e^-$ collisions: physics of SLC and LEP.** Dorfan, J.M. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Apr 1986. Contract AC03-76SF00515. 32p. (CONF-860292—5). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87010843.

From Lake Louise winter institute in particle physics; Edmonton, Alberta, Canada (16 Feb 1986).

A brief historical review is given of the contribution to particle physics of $e^+e^-$ interactions, followed by a discussion of the LEP and SLC machines and the reasons for developing linear colliders. A brief overview of the Standard Model and some essential formalism for the process $e^+e^- \rightarrow$ f anti f are presented, followed by a discussion of detectors. Tests of the Standard Model and physics beyond the Standard Model that can be made running at the $Z^0$ are considered. LEP physics at energies above the $Z^0$ is discussed. (LEW)

38146 (SLAC-PUB—4287) **Experimental tests of quantum chromodynamics.** Dorfan, J. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Apr 1987. Contract AC03-76SF00515. 68p. (CONF-860736—16). NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87010547.

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

Experimental tests of quantum chromodynamics are discussed in the $e^+e^-$ continuum, in pp and anti p p collisions, in measurements of $\alpha$/sub s/ from Y decays, in deep inelastic lepton scattering, and in the measurement of the photon structure function. A large body of data relating to the testing of quantum chromodynamics is reviewed, showing qualitative agreement between the data from a wide range of processes and QCD. 66 refs., 79 figs. (LEW)

38147 (SLAC-PUB—4300) **Search for CP violation in $B^0$ [and $D^0$] decays II: A closer look.** Bigi, I.I. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Apr 1987. Contract AC03-76SF00515. 7p. (CONF-870170—1). NTIS, PC A02/MF A01; GPO Dep. File Number DE87009893.

From Workshop on a linear-collider B anti B factory; Los Angeles, CA, USA (26 Jan 1987).

Recent findings from UA1 and ARGUS on $B^0$ - anti $B^0$ mixing brighten considerably the prospects of findings CP violation in $B^0$ decays. We sketch some semi-quantitative scenarios where we also address technical issues like the amount of time that is necessary. We point out that searching for the reaction $\Upsilon(4s) \rightarrow B^0$ anti $B^0 \rightarrow f_1, f_2$, (where f/sub x/ = line integral), where $f_1$, $f_2$ are CP eigenstates of the same CP parity has a good chance of revealing CP violation. The tight upper bound on $D^0$ - anti $D^0$ mixing, namely 0.5-1%, still allows for CP asymmetries of up to 5% in (-) $D^0 \rightarrow K^+K^-$, K/sub s/$K^+K^-$.

38148 (SLAC-PUB—4312) **An upper limit on the decay $D^0 \rightarrow \mu e$.** Stockhausen, W. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Apr 1987. Contract AC03-76SF00515. 4p. (CONF-870390—5). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011591.

From 22. Recontres de Moriond: electroweak interactions and unified theories conference; Les Arcs, France (8 Mar 1987).

A search for the lepton family number violating decay $D^0 \rightarrow \mu e$ is reported. No signal is observed in a data sample of 9.3 $pb^{-1}$ collected at the psi(3770) resonance with the Mark III detector, where 0.18 +- 0.06 +- 0.05 background events are expected. A

90% confidence level upper limit on the branching fraction B($D^0 \to \mu e$) of 1.5 x $10^{-4}$ is obtained.

38149 **(SLAC-PUB—4313) The decay tau → rho nu (and rho → π eta nu?).** Stockhausen, W. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Apr 1987. Contract AC03-76SF00515. 5p. (CONF-870390—6). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011592.

From 22. Recontres de Moriond: electroweak interactions and unified theories conference; Les Arcs, France (8 Mar 1987).

Motivated by the question of missing exclusive branching fractions in tau decays, mostly suspected to be in one prong decays with neutrals, we have studied the decay tau → rho nu in tau pair production by $e^+e^-$ annihilation at $\sqrt{s}$ = 3.77 GeV. The branching fraction is measured to be B(tau → rho nu) = (23.0 +- 1.3 +- 1.7)% consistent with known measurements and not offering a solution to the branching ratio question. No eta signal in the γγ mass spectrum pointing to a decay tau → eta π nu is obvious. An upper limit on this branching fraction is given.

38150 **Comparison of narrow-band and wide-band neutrino beams in the search for ν/sub μ/→ν/sub e/ oscillations.** Ahrens, L.A.; Aronson, S.H.; Gibbard, B.G.; Murtagh, M.J.; White, D.H.; Callas, J.L.; Cutts, D.; Hoftun, J.S.; Diwan, M.; Lanou, R.E.; and others. (Physics Department, Brookhaven National Laboratory, Upton, New York 11973). *Physical Review* [*Section*] *D: Particles and Fields;* **36**: No. 3, 702-706(1 Aug 1987).

Motivated by the apparent advantages of a narrow-band neutrino beam for neutrino-oscillation experiments, a search for ν/sub μ/→ν/sub e/ was made with a magnetic horn-focused 3-GeV narrow-band neutrino beam. The detector and its distance from the neutrino source were the same as in a previous search for ν/sub μ/→ν/sub e/ with a horn-focused wide-band neutrino beam of mean energy 1.2 GeV. A direct comparison of the results of the two searches is made, and a brief survey of events induced by a 1.3-GeV narrow-band neutrino beam is noted.

38151 **Measurement of the ratio of Σ0 to $\Lambda^0$ inclusive production from 28.5-GeV/c protons on beryllium.** Sullivan, M.W.; Jensen, D.A.; Kreisler, M.N.; Marcin, M.; Raychaudhuri, K.K.; Bunce, G.M.; Makdisi, Y.; Yamin, P.; Dukes, E.C.; Overseth, O.E.; and others. (Department of Physics and Astronomy, University of Massachusetts, Amherst, Massachusetts 01003). *Physical Review* [*Section*] *D: Particles and Fields;* **36**: No. 3, 674-689(1 Aug 1987).

The ratio of the cross section for $\Sigma^0$ inclusive production to the cross section for $\Lambda^0$ inclusive production has been measured with 28.5-GeV/c protons incident on a beryllium target at an average laboratory production angle of 4°. This ratio was measured to be 0.278 +- 0.011 +- 0.05, where the uncertainties are statistical and systematic in that order. The ratio does not depend strongly on the momentum of the produced particle between 10 and 24 GeV/c. The effect of $\Sigma^0$ contamination on previous determinations of the polarization of inclusively produced $\Lambda^0$'s is discussed.

38152 **Limit on the anti ν mass in free molecular tritium beta decay.** Bowles, T.J.; Wilkerson, J.F.; Browne, J.C.; Maley, M.P.; Robertson, R.G.H.; Knapp, D.A.; Helffrich, J.A. (Los Alamos National Lab., NM; Princeton Univ., NJ; California Univ., San Diego, La Jolla). pp 782-785 of Weak and electromagnetic interactions in nuclei. Proceedings. Klapdor, H.V. (ed.). Berlin, Germany, F.R.; Springer (1986). (CONF-860741—).

From International symposium on weak and electromagnetic interactions in nuclei; Heidelberg, F.R. Germany (1 Jul 1986).

38153 **Search for short-lived axions emitted from neutron capture on protons.** Freedman, S.J.; Arnold, M.; Doehner, J.; Last, J.; Dubbers, D. (Argonne National Lab., IL; Heidelberg Univ., Germany, F.R.; Institut Max von Laue - Paul Langevin, 38 - Grenoble, France). pp 871-874 of Weak and electromagnetic interactions in nuclei. Proceedings. Klapdor, H.V. (ed.). Berlin, Germany, F.R.; Springer (1986). (CONF-860741—). Contract W-31-109-ENG-38.

From International symposium on weak and electromagnetic interactions in nuclei; Heidelberg, F.R. Germany (1 Jul 1986).

We have searched for a light neutral particle like the axion, which decays rapidly to positron-electron pairs, produced in the reaction n+p -> D+a. Instead of axions we found the $e^+e^-$ signal expected from direct internal pair conversion. A preliminary analysis gives (Γ/sub p//Γ/sub γ/)/sub expt//(Γ/sub p//Γ/sub γ/)/sub cal/ = 1.06+-0.12, for the measured to expected pair decay branching ratio. These results exclude existing axion models over the mass range 2 m/sub e/<m/sub a/<2.22 MeV/$c^2$. The axion mass would fall in this range if the axion was the explanation for the narrow positron lines observed in recent heavy-ion experiments at the GSI. 555 figures.

38154 **Search for gluonic bound states in high energy proton-proton collisions.** Isenhower, L.D. Ames, IA; Iowa State Univ. (1986). 180p. University Microfilms Order No. 87-03,717.Contract W-7405-ENG-82.

Thesis (Ph. D.).

The Double Pomeron Exchange process is studied as a potential source for the production of gluonic bound states utilizing the intersecting Storage Rings at the European Organization for Nuclear Research in Geneva, Switzerland. Three different triggers are studied, which differ in the requirements placed on the slow central system produced by the Pomeron-Pomeron interaction. Exclusive four and six prong events are studied. A spin-parity analysis is performed on the $\pi^+\pi^-$ system in the exclusive channel pp → pp$\pi^+\pi^-$ for two of the triggers. The exclusive process pp → ppK/sub S/$^0$K /sup +/-/ π/sup +/-/ is also studied and the $K^0K\pi$ mass spectrum is examined. An enhancement is seen in the region of 1500 MeV, but it appears to originate from events which have missing tracks, rather than from the exclusive final state. While this does not preclude its interpretation as a genuine resonant state, it does not mean that a definite statement cannot be made on the basis of this analysis.

38155 **(BNL—39765) Monte Carlo determination of the spin-dependent potentials.** Campostrini, M.; Moriarty, K.J.M.; Rebbi, C. (Brookhaven National Lab., Upton, NY (USA); Istituto Nazionale di Fisica Nucleare, Pisa (Italy); Dalhousie Univ., Halifax, Nova Scotia (Canada); Boston Univ., MA (USA)). May 1987. Contract AC02-76CH00016. 8p. (CONF-8609142—6). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010760.

From Lattice gauge theory meeting; Upton, NY, USA (15 Sep 1986).

Calculation of the bound states of heavy quark systems by a Hamiltonian formulation based on an expansion of the interaction into inverse powers of the quark mass is discussed. The potentials for the spin-orbit and spin-spin coupling between quark and antiquark, which are responsible for the fine and hyperfine splittings in heavy quark spectroscopy, are expressed as expectation values of Wilson loop factors with suitable insertions of chromomagnetic or chromoelectric fields. A Monte Carlo simulation has been used to evaluate the expectation values and, from them, the spin-dependent potentials. The Monte Carlo calculation is reported to show a long-range, non-perturbative component in the interaction. (LEW)

38156 **(DESY—86-156) Strong CP problem and the visibility of invisible axions.** Buchmueller, W. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.); Hannover Univ. (Germany, F.R.). Inst. fuer Theoretische Physik). Dec 1986. 31p. (ITP-UH—15/86; CONF-8609221—2). NTIS, PC E07; Available from NTIS as TIB/B87-07042.

From International school on low energy antiproton physics; Sicily, Italy (27 Sep 1986).

The main subject of these lectures are general properties of axions and recent suggestions of how to detect invisible axions. After a brief review of the strong CP problem and the Peccei-Quinn mechanism in sects. 2 and 3, we discuss axion properties by

means of an effective lagrangian approach in sect. 4. Experimental bounds on axion production and decays are reviewed in sect. 5. Sect. 6 deals briefly with the recently proposed variant axion models, and in sect. 7 we discuss the possible relevance of supersymmetry to the strong CP problem. In sect. 8 we then review the different proposals for the detection of invisible axions. Some conclusions are given in sect. 9. (orig./HSI).

**38157 (DOE/ER/02271—110) Theoretical high energy physics: Progress report for the period May 1, 1986-April 30, 1987.** Lee, T.D. (Columbia Univ., New York (USA). Dept. of Physics). May 1987. Contract AC02-76ER02271. 25p. (COO—2271-110). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010235.

Work is reported in the area of implementing QCD with dynamical fermions on a lattice parallel processor. Work on lattice gauge theory is reported, particularly the construction and use of high speed parallel computers for the Monte Carlo simulation of lattice quantum chromodynamics. Other work includes research on the long-range forces that arise from multi-photon exchange between diverse systems, and particle-antiparticle oscillations. Also reported is work on composite-Higgs models, composite fermion models, calculating corrections propagators in near-constant background fields, and calculating gluon scattering amplitudes using techniques derived from string theory. Soliton stars, black holes, and Hawking radiation were studied. An analytic expression was found for an inclusive two minijet cross section at collider energies in QCD. The very early stage of an ultra-relativistic heavy ion collision was studied. Research on glueball masses in QCD, the first Chern number of the normal bundle of work surface of a string, and computation of the rate of baryogenesis via processes involving homotopically nontrivial paths on configuration space is also reported. Problems arising from the application of high energy physics to the study of cosmology are also studied. (LEW)

**38158 (DOE/ER/03130—630) A research program in theoretical high-energy physics: Progress report.** Feldman, D.; Fried, H.M.; Jevicki, A.; Kang, Kyungsik; Tan, Chung-I. (Brown Univ., Providence, RI (USA). Dept. of Physics). 30 Jun 1987. Contract AC02-76ER03130. 39p. (COO—3130TA-630; BROWN/HET—630). NTIS, PC A03/MF A01; GPO Dep. File Number DE87012064.

Accomplishments are reported in the areas of string theory, nonperturbative analyses in quantum field theories, flavor gauge theory and grand unification theories, physics at the very early universe and quantum field theory, and critical phenomena in quantum field theory. (LEW)

**38159 (DOE/ER/03130—T13) Research program in computational physics: [Progress report for Task D].** Guralnik, G.S. (Brown Univ., Providence, RI (USA). Dept. of Physics). 1987. Contract AC02-76ER03130. 18p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87011869.

Studies are reported of several aspects of the purely gluonic sector of QCD, including methods for efficiently generating gauge configurations, properties of the standard Wilson action and improved actions, and properties of the pure glue theory itself. Simulation of quantum chromodynamics in the "quenched approximation", in which the back reaction of quarks upon gauge fields is neglected, is studied with fermions introduced on the lattice via both Wilson and staggered formulations. Efforts are also reported to compute QCD matrix elements and to simulate QCD theory beyond the quenched approximation considering the effect of the quarks on the gauge fields. Work is in progress toward improving the algorithms used to generate the gauge field configurations and to compute the quark propagators. Implementation of lattice QCD on a hypercube is also reported. (LEW)

**38160 (DOE/ER/40073—T2) Theoretical high energy physics research at the University of Chicago: Technical progress report [for 1986].** Rosner, J.L. (Chicago Univ., IL (USA)). 1987. Contract AC02-82ER40073. 15p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011217.

Research activities reported include: exotic fermions and gauge bosons in superstring models, collider physics, heavy quark spectroscopy, CP violation, color sextet quarks, neutral heavy leptons, fermion masses and supersymmetry, magnetic moments of baryons and other constraints on configuration mixing, dynamical mass generation, N = 2 supersymmetric QCD, and matrix methods in quantum mechanics. Other work addresses a fixed-target program and other non-SSC initiatives, hadroproduction of heavy quarks, electroproduction phenomenology at very small values of x, and spectrometer designs for the SSC. The novel physics possibilities of hadron colliders have been considered, and work is reported on radiative decays of the J/psi and on D-wave quarkonium levels, on the connection of elementary particles with cosmology and astrophysics, and conformal field theory. A rigorous development of the theory of super Riemann surfaces was developed with a view toward superstring applications. Work was pursued on supersymmetry breaking in the observable sector of superstring models and on inflationary cosmology. (LEW)

**38161 (DOE/ER/40150—12) Short range phenomena.** Chang, C.C.; Gross, F. (Maryland Univ., College Park (USA); Continuous Electron Beam Accelerator Facility, Newport News, VA (USA)). 1986. Contract AC05-84ER40150. 21p. (CEBAF-PR—86-007; CONF-8604194—9). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87008662.

From International symposium on three-body force in the three-nucleon system; Washington, DC, USA (24 Apr 1986).

The theoretical approaches to treating quark degrees of freedom and relativistic effects in short range phenomena are summarized. One issue emphasized with regard to all the approaches discussed is the extent to which charge and current operators can be unambiguously determined from the underlying dynamics. If these operators are not constrained by the dynamics, then the electromagnetic experiments described would be expected to be less effective in giving direct information about the underlying physics. Recommendations for future work in the area are summarized. (LEW)

**38162 (DOE/ER/40158—3) The theory of high energy collision processes: Technical progress report, January 1, 1986 through December 31, 1986.** (Harvard Univ., Cambridge, MA (USA). Div. of Applied Sciences). 15 Jan 1987. Contract FG02-84ER40158. 5p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87010682.

Progress is reported in these areas: detailed prediction of p anti p total and elastic differential cross sections at Tevatron of Fermilab; application of the method of helicity amplitudes to the gluon production of heavy quarkonium states; investigation of SU(2) lattice gauge theory in the limit of small coupling constants, with emphasis on the appearance of caustics; interpretation of sharp peaks in the positron spectrum from heavy nucleus collisions in terms of axions; analysis of the diagrammatic rules for finite-temperature field theory in Minkowski space; and quantum-mechanical calculation of bremsstrahlung. 14 refs. (LEW)

**38163 (DOE/ER/40200—091) Radiative B decays with four generations.** Hewett, J.L. (Texas Univ., Austin (USA). Center for Particle Theory). Feb 1987. Contract W-7405-ENG-82;FG05-85ER40200. 14p. (IS-J—2454). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010914.

We study the decay $b \to s\gamma$ in the four generation model including the effects of QCD corrections. We find the fourth generation contributions to be quite significant, extending the range of allowed branching ratios, $BR(b \to s\gamma)$, to lie both above and below the three generation standard model value. The existence of a fourth family of quarks would make a prediction for the top quark mass difficult to obtain from this process.

**38164 (DOE/ER/40200—092) Leptonic polarization asymmetries at $e^+e^-$ colliders in $E_6$ theories.** Hewett, J.L.; Rizzo, T.G. (Texas Univ., Austin (USA). Center for Particle Theory). Mar 1987. Contract W-7405-ENG-82;FG05-85ER40200. 29p. (IS-J—2469). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87010915.

We examine the left-right and azimuthal polarization asymmetries of lepton pairs produced in $e^+e^-$ and $e^-e^-$ interactions as probes of new physics resulting from $E_6$ theories. The asymmetries are calculated and compared for the processes $e^+e^- \to \mu^+\mu^-$, $e^+e^-$

$\rightarrow e^+e^-$, $e^-e^- \rightarrow e^-e^-$, and $e^+e^- \rightarrow L^+L^-$ where L is either an $E_6$ exotic, mirror, or fourth generation heavy lepton. Our results show that lepton polarization asymmetries can be used to easily distinguish different $E_6$ models and can be used to distinguish among possible new heavy leptons L.

38165 (SLAC—306, pp 1-12) **Search for flavor-changing neutral currents at the $Z^0$.** Barbiellini, G.; Sadrozinski, H.F.W. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

In view of the hopefully large number of produced $Z^0$ in the coming years with the advent of SLC and LEP, the experimental possibility of an ideal detector to separate events from expected $Z^0$ decays into pairs of light and heavy quarks from the events from flavor changing neutral currents FCNC has been considered. Theoretical expectations for FCNC are very small in the standard model due to GIM cancellations, but could be larger ($\sim 10^{-4}$) with very heavy quarks in supersymmetric models or in case of a fourth generation. Furthermore, there are predictions that CP violation is maximal in such systems. In this work high efficiency algorithm is sought to separate on global jet parameters the such events.

38166 (SLAC—306, pp 23-39) **Physics from $Z^0$ measurements: mass, width, and total cross section.** Rankin, P. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

This is an interim report on the activities of Working Group 1. The aim of this group is to enable as accurate a measurement as possible of the mass, width and total peak cross section of the $Z^0$ resonance to be made by the Mark II group at the SLC. Why we wish to do this is discussed in sections 2, how we can do it in sections 3 and 4. Section 3 deals with experimental limitations and sets the scale for how well we wish to control the theoretical uncertainties reviewed in section 4. Finally section 5 summarizes the problems to be resolved and our expectations.

38167 (SLAC—306, pp 40-44) **Renormalization of electroweak interactions and the BREMMUS Monte Carlo simulator.** Kennedy, D.C. II; Lynn, B.W. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

This is a progress report on BREMMUS, the electroweak Monte Carlo simulation program originally developed for SLC/LEP physics by B.W. Lynn, R.G. Stuart, F.A. Berends, and R.H. Kleiss. The ultimate goal of BREMMUS development is a simulator that contains all of the numerically important contributions at SLC energies to the inclusive $e^+e^-$ light fermion production cross sections. This is an ambitious objective and, as such, requires a step-by-step approach in order to obtain reliable results.

38168 (SLAC—306, pp 45-65) **Study of QED radiative corrections at the Z.** Alexander J.; Bonvicini, G.; Drell, P.; Frey, R.; Milliken, B. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

Precision tests of the electroweak theory in the Z region require a careful understanding of radiative corrections. The authors have been working to define clearly which theoretical results, analysis tools and cross checks are needed for such experiments. The authors will first describe the physics that is included in the event generator program MMG1 and will comment on the requirements for a generator suitable for the analysis of the MKII energy scan around the Z. Second, the authors will present results of an ongoing comparison between MMG1 and an exponentiation calculation from Bob Cahn. Third, the authors will discuss the event generator structure with particular emphasis on the fundamental numerical approximation inherent to this kind of generator. Fourth, the authors will present some results from this generator and its behavior in a narrow resonance region.

38169 (SLAC—306, pp 66-69) **Renormalization group improved Yennie-Frautschi-Suura Theory and Monte Carlo event generators.** Jadach, S.T.; Ward, B.F.L. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

The authors describe the elements and the status of implementation of a procedure for incorporating renormalization group improved Yennie-Frautschi-Suura theory in an explicit algorithm for Monte Carlo event generation with an eye toward the high precision $Z^0$ physics at SLC and LEP.

38170 (SLAC—306, pp 89-99) **Status of Monte Carlos for a tau pair production at SLC.** Burchat, P. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

The Monte Carlos for tau-pair production at the SLC, including spin effects and polarized beams, are in good shape. There are two quite independent, fairly complete Monte Carlos KORALZ and LUND/tau. The main limitation of both Monte Carlos at this point is the lack of higher multiplicity decay modes. The addition of these modes is in progress for both Monte Carlos. It is not necessary that all spin effects be included for these modes. The predictions of the two Monte Carlos are in agreement with each other and with theoretical predictions within statistical errors. More precise checks will be made with more statistics in the future.

38171 (SLAC—306, pp 100-113) **Report on electroweak parameters.** Matthews, J. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

The measurements of the fundamental parameters of the Glashow-Salam-Weinberg model are one of the primary goals of the Mark II collaboration at the SLC. The plan for this note is as follows. Section II reviews the standard model assumptions and the present status of the world measurements of sin (theta-weak)**2. The Mark II measurements at the mass of the $Z^0$ are summarized in Section III; this section closes with a discussion of the luminosity requirements for the Mark II measurements of sin (theta-weak)**2. The author expectations for the Mark II/SLC tests of the Standard Model are summarized in Section IV.

38172 (SLAC—306, pp 114-127) **Forward-backward asymmetry for b and c quarks.** Wagner, S.; Smith, J.; White, S. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

In this paper we discuss methods used to measure heavy quark asymmetries at PEP and PETRA and their application to our future SLC data. The results given are from talks by Jim Smith at Asilomar and Steve Wagner at Granlibakken. The tagging of $e^+e^- \rightarrow Z^0 \rightarrow$ c ant c events is done with D/sup *+/ mesons selected with the Dm technique. This method has been tested with good results with the Mark II Upgrade PEP data. Since this analysis is already fully documented, a detailed description of the D/sup *+/ selection procedure and the associated plots is omitted from this paper. Studies of the familiar techniques of tagging $e^+e^- \rightarrow Z^0 \rightarrow$ b ant b events with high pt leptons are discussed. An alternative technique for measuring the b quark asymmetry with vertex tagging and the determination of the quark charge from the jet charge is also described. We estimate the expected statistical precision of the above measurements for a sample of $10^6$ $Z^0$ events collected with the Mark II detector at the SLC.

38173 (SLAC—306, pp 128-140) **Status report on the polarization facility at the SLC.** Moffeit, K.C. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

The project to provide polarized electrons for SLC is now approved and work has begun. The author plant to have the systems installed by the end of the summer of 1988. A key test of

SLAC's resolve to meet this schedule will be placing the order for the superconducting solenoids by the end of 1986.

38174 (SLAC—306, pp 141-151) **Search for new interactions via lepton flavor violation at or beyond the $Z^0$ pole.** Heusch, C.A. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

Looking for flavor-changing weak currents (FCNC) in the charged lepton sector is a natural task to be performed in $e^+e^-$ annihilation experiments. Stringent limits from rare decay experiments involving electrons and muons make the search for non-diagonal matrix elements containing a tau most promising. Signatures are reasonably straight-forward in the framework of the MARK II/ SLC Detector, with etau final-state sensitivities better by a factor 3 to 5 than μtau. This ratio may not be as sever for some of the LEP detectors. Assuming standard (minimal) $Q^2$-dependencies for new interactions, this search leads to sensitivities of their energy scale at a level of ~ 1 TeV (SLC) to ~ 12 TeV (LEP II). While we do not wish to tie this project up with a specific model, we note that many Standard Model extensions would permit the appearance of lepton-flavors non-diagonal terms at a level which cannot be predicted reliably; their experimental investigation is therefore all the more strongly indicated.

38175 (SLAC—306, pp 152-158) **Monte Carlo models for top production.** O'Shaughnessy, K. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

This note describes some of the results that the Open Top Subgroup has obtained in the study of top production in QCD Monte Carlos. Section II recalls the conclusions reached at the Mark II Collaboration workshop at Asilomar in March, 1986. Section III describes top production in the current versions of the Monte Carlos that are available. In Section IV, several physical quantities predicted by the models are compared. Finally, Section V draws some conclusions about the ways the different models can be used for open top studies at SLC energies. We now have a variety of QCD Monte Carlos which produce t ant t events. These models fit the PEP data moderately well and are consistent in their predictions at SLC energies. However, some event parameters vary significantly from model to model, for example the aplanarity of the event. It is necessary to test top analysis programs on the different models to check the model independence of a given method. Ideally we would like to have several model-independent analysis methods which could be used to establish a top signal and determine the top mass.

38176 (SLAC—306, pp 159-188) **Finding open top.** Hanson, G. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

This report summarizes the work of the Open Top Subgroup. Kathy O'Shaughnessy and Alfred Petersen have described the Monte Carlo models which we use for open top production and for non-top multihadronic background. In addition to investigating the models, our work can be divided into three topics: (1) establishing a top signal; (2) measuring the top mass; and (3) establishing that what we find is really top. The work on these topics will be discussed in the following sections.

38177 (SLAC—306, pp 189-211) **Supersymmetric particle searches.** Barklow, T. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

Previous experimental results for the production of supersymmetric particles are briefly reviewed. The variables which can be used to isolate such events are then discussed and event simulation is described. Distinguishing events from background is considered.

38178 (SLAC—306, pp 212-219) **Small visible energy events and close-mass lepton pairs.** Perl, M.L. (Stanford Univ., CA). 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

In this paper, presented at the XXIII International Conference on High Energy Physics, recent reviews on the search for new leptons beyond the electron, muon, and tau generations are updated. An unexplored region in the mass ranges of leptons: small visible energy events in electron-positron annihilation and close-mass pairs is discussed.

38179 (SLAC—306, pp 220-253) **Toponium physics with a small data sample.** Porter, F. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

The first data samples on toponium in $e^+e^-$ will naturally be rather small. In this note, the author will investigate what physics may be accessible with such a small dataset (of order 1k toponium decays). This is basically a summary of my talk at the Mark II workshop at Granlibakken, and is a report on work by the Mark II toponium working group. This group has concerned itself principally with two questions: (1) will the event rate at the SLC be sufficient to find toponium in a reasonable period of time, and what size event sample could the Mark II hope to achieve on toponium; and (2) given such a sample of events, what physics topics (if any) can be addressed.

38180 (SLAC—306, pp 254-273) **Reconstructing heavy long-lived neutral leptons.** Weinstein, A. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

This report summarizes some work that has been done on reconstruction of heavy, long-lived neutral leptons (neutrinos). In the first section we review models of the production and decay of heavy neutrinos. We then discuss a Monte Carlo study to isolate and reconstruct the heavy neutrinos and measure their mass and lifetime. The discussion includes a digression on trigger and track reconstruction efficiency and resolution. Finally we review the work that remains for improving our algorithms and generalizing our search.

38181 (SLAC—306, pp 274-319) **New stable charged particles.** Banks, T.; Bartelt, J.; Boyarski, A.; Karliner, M.; Peck, C.; Soderstrom, E.; Stroynowski, R. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

The subject of new stable charged particles encompasses a large range of possible topics. For the purpose of present discussion we have narrowed it down to the problems related to charged particles with lifetime longer than $10^{-10}$ sec, which would appear as tracks in the drift chamber of the Mark II. These include absolutely stable new particles with electrical charge +/- 1 as well as particles which may decay beyond the tracking volume of the detector. In addition, we address the problem of the detection of free quarks with charges 1/3 and 2/3 and discuss the procedure to detect Dirac type magnetic monopoles. The outline of this note is as follows: in Section 1, the theoretical expectations are summarized and most likely theoretical candidates for new stable particles are describes in some detail, Section 2 contains a discussion of the detection of massive long lived particles with charge 1, while Section 3 and 4 describe searches for free quarks and magnetic monopoles.

38182 (SLAC—306, pp 320-326) **Summary of work on $Z^0 \rightarrow$ Higgs neutrinos antineutrinos.** Wood, D. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

This document describes the status, as of the Granlibakken workshop, of the study of the search for $Z^0 \rightarrow$ Higgs neutrinos antineutrinos.

38183 (SLAC—306, pp 327-340) **Higgs boson production at the Z⁰ and the possibilities of vertex detectors.** Schwarz, A.S. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

The process $Z^0 \rightarrow Z^{0*}H^0$ is generally accepted to be the most promising production process of the standard model neutral Higgs boson in the vicinity of the $Z^0$ pole. up to now the general attention focussed mainly on the leptonic decay modes of the (virtual) $Z^0$ and here again mainly on the electron and muon final state. The advantage of this mode is clear: assuming even moderate electron and muon identification, the final state is spectactularly clean: two high energy leptons recoiling against the decay products of the Higgs boson. The recoil mass calculated from the momenta of the two leptons in addition would peak at the mass of the Higgs boson. However, despite its clean signature, the rates for this process are rather low (e.g. only 3.2-3.4% of the $Z^0$ decays proceed through $Z^0 \rightarrow u+u$-). So the natural conclusion is, to try to incorporate the other decaymodes of the $Z^0$ as well. The different decay modes of the $Z^0$ have been grouped into charged lepton pairs, neutrino pairs and quark pairs respectively, since these lead to distinctly different event topologies. The top quark has been assumed to be too heavy to be produced in the decays of the $Z^0$ decays and hence the top quark will not be discussed further. The event topology with the $Z^0$ decaying into electrons/muons has been discussed elsewhere and so this note will concentrate on those modes where $Z^0 \rightarrow$ nu anti nu and $Z^0 \rightarrow$ q anti q.

38184 (SLAC—306, pp 341-347) **Summary of work on $Z^0 \rightarrow$ Higgs anti ff.** Innes, W. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

To summarize the outlook for low mass Higgs searches, we expect 1-2 tagged events per $10^4$ Z decays for m/sub H/ $\leq$ 4 GeV/c². The identity of a few events will be ambiguous. A few tens of Higgs events will have characteristics which say, Higgs. The overall situation for Higgs searching is much the same as for low mass Higgs. Somewhat more then $10^5$ Z decays are required to before we can hope to observe Higgs mesons. To reach masses near 30 GeV/c² $10^6$ Z decays are needed. The only practical way observe masses much higher than this is through toponium decay (if toponium is below the Z).

38185 (SLAC—306, pp 348-351) **Summary of work on QCD backgrounds to $Z^0 \rightarrow H^0$ anti ell ell.** Weir, A. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

In the region M/sub Higgs/ > 5 GeV/c² the dominant background to the process $Z^0 \rightarrow H^0$ ell (where ell anti ell is either $e^+e^-$ or $\mu^+\mu^-$) comes from $Z^0 \rightarrow$ t and t events in which both quarks decay semi-leptonically producing a pair of high energy leptons in the final state. To examine this background a Monte Carlo simulation was performed using 10,000 generated $Z^0 \rightarrow$ t anti t events in which both top quarks decayed semi-leptonically for top quark masses of 25, 35 and 42.5 GeV/c². The results of this simulation are normalized to a sample of $10^6$ produced $Z^0$s. They show that the $H^0$ signal should be clear up to M/sub Higgs/ of 35-40 GeV/c² in the $e^+e^-$ channel. The $\mu^+\mu^-$ channel will provide a useful check up to masses of $\sim$ 30 GeV/c².

38186 (SLAC—306, pp 352-388) **Comparison of multihadronic event generators.** Petersen, A. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

In this paper we present general properties of hadronic final states produced by $e^+e^-$ annihilation at center-of-mass energies of E/sub cm/ = 29 GeV, measured with the Mark II detector at the PEP storage ring. Although these results stand on their own, it is interesting to compare them with future data taken in the 90 GeV region with the SLAC linear collider. It is also important to see whether these QCD plus fragmentation models are able to describe the data over such a wide energy range.

38187 (SLAC—306, pp 389-396) **Granlibakken meeting: b and c quark summary.** Ford, W.T. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

Several topics addressed by the working group are briefly described. These include: the vertex detector, charm and bottom decays, lepton identification, bottom lifetime, top decay and Higgs production.

38188 (SLAC—306, pp 397-419) **Study of $D^+ \rightarrow K^-\pi^+\pi^+$ selection using the vertex drift chamber.** Hayes, K. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

Use of the vertex chamber information allows us to select $D^+ \rightarrow K^-\alpha^+\alpha^+$ decays in $Z \rightarrow$ c anti c ($Z \rightarrow$ b anti b) events with an overall efficiency of about 15% (9%) for a signal-to-background ratio of about 4 (2). The physics which can be done with these selected decays depends on the size of the Z sample. In a sample of 10,000 hadronic Z decays, we could expect to tag about 16 $D^+$ from $Z \rightarrow$ c anti c and 11 $D^+$ from $Z \rightarrow$ b anti b events. There would be a few clean examples of $b \rightarrow c$ cascade decays where both decay vertices are well measured. With 100,000 Z decays, a good measurement of the $D^+$ production rate and x/sub D/ distribution in $Z \rightarrow$ c anti c and $Z \rightarrow$ b anti b decays could be made. We also may be able to make a reasonable measurement of the fraction of $D^+$ which have neutral parents. The $D^+$ sample could be combined with other b and c quark tagged samples to measure the Z decay assymmetry. With 1,000,000 Z decays we would have a fair chance to measure the average $D^+$ parent lifetime in $Z \rightarrow$ b anti b events. If the fraction of $D^+$ decays having neutral parents is sufficiently close to one, we could measure the charged and neutral B lifetimes.

38189 (SLAC—306, pp 432-442) **Counting neutrinos at SLC.** Thun, R. 1986. NTIS, PC A 14. File Number DE87010325. (CONF-8609174—).

From 2. Mark II workshop on SLC physics; Tahoe City, CA, USA (14 Sep 1986).

Determination of the number of neutrino species is an important physics goal within reach of the new high-energy electron-positron colliders. The MKII is a suitable detector for measuring both the $Z^0$ total decay width as well as the cross section of $e^+e^- \rightarrow \gamma$nu anti nu for this determination. For the latter measurement care must be taken to detect showering background particles down to angles of 15 m with high efficiency. At the desired level of accuracy, the width measurement requires an integrated luminosity of about $10^{36}$ cm⁻², whereas the single photon measurement is likely to require a dedicated run about 4 GeV above the $Z^0$ peak with an integrated luminosity of about 3 x $10^{36}$ cm⁻². These luminosity estimates are realistic in that they include some margin for efficiencies and systematic errors. The single-photon measurement can be attempted first in a parasitic mode while taking data on resonance. A prerequisite is that a viable single-photon trigger with an energy threshold of 1 GeV be added to the general MKII trigger. Whether or not the MKII collaboration succeeds in neutrino-counting will depend primarily on the SLC machine performance during the MKII era.

38190 (SLAC—312, pp 1-32) **Electroweak interactions - standard and beyond.** Harari, H. (Weizmann Institute of Science, Rehovot, Israel). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

Several important topics within the standard model raise questions which are likely to be answered only by further theoretical understanding which goes beyond the standard model. In these lectures they present a discussion of some of these problems, including the quark masses and angles, the Higgs sector, neutrino masses, W and Z properties and possible deviations from a pointlike structure.

**38191** (SLAC—312, pp 223-230) **Theoretical understanding of charm decays.** Bigi, I.I. (Stanford Univ., CA). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

A detailed description of charm decays has emerged. The author sketches the various concepts involved. Although this description is quite successful in reproducing the data the chapter on heavy flavor decays is far from closed. Relevant questions like on the real strength of weak annihilation, Penguin operators, etc. are still unanswered. He tries to identify important directions in future work, both on the experimental and theoretical side.

**38192** (SLAC—312, pp 231-238) **Toponium-$Z^0$ mixing.** Franzini, P.J. (Stanford Univ., CA). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

The subject of $Z^0$-toponium interference is briefly reviewed. The qualitative features of the $Z^0$ mixing with one t anti t state are discussed. Effects of mixing with the full t anti t spectrum, of the smearing due to beam spread, and of different potentials, are then shown.

**38193** (SLAC—312, pp 349-360) **Resonant neutrino oscillations.** Parke, S.J. (Fermi National Accelerator Lab., Batavia, IL). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

Analytic results are derived for the electron neutrino survival probability after passage through a resonant oscillation region. This survival probability together with a sophisticated model of the production distribution of the solar neutrino sources and the solar electron number density are used to study the effects of resonant neutrino oscillation in the solar interior on the current and proposed solar electron neutrino experiments.

**38194** (SLAC—312, pp 693-702) **Compositeness below 1 TeV.** Jaffe, R.L. (Massachusetts Institute of Technology, Cambridge). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

A composite model of quarks, leptons and gauge bosons is proposed. In this model, a version of the standard Glashow-Salam-Weinberg model in which the SU(2)sub L gauge interaction becomes strongly coupled, compositeness at energies below 1 TeV is predicted. An important question which is explored is how the Glashow-Salam-Weinberg Lagrangian is realized in nature. Constraints on compositeness are considered and electromagnetism in the model is discussed.

**38195** (SLAC—312, pp 703-712) **Changing view of hadron structure.** Bjorken, J.D. (Fermi National Accelerator Lab., Batavia, IL). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

Beginning before World War II, the author reviews the history of the realization that nucleons have structure. The author discusses early ideas such as Yukawa couplings of pions to nucleons and shows how the deficiencies of such models and data on pion scattering led to dispersion theory. The author then describes the rise of quark models and finally unified gauge models and quantum chromodynamics.

**38196** (SLAC-PUB—4315) **Overview of the standard model.** Gilman, F.J. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Apr 1987. Contract AC03-76SF00515. 16p. (CONF-870278—2). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010313.

From 4. family of quarks and leptons international symposium; Santa Monica, CA, USA (26 Feb 1987).

A few problem areas in relation to the standard model are discussed: the Kobayashi-Maskawa matrix, CP violation in the neutral kaon system, B-anti B mixing, and tau decays. 50 refs. (LEW)

**38197** (SLAC-PUB—4323) **Testing quantum chromodynamics in electroproduction.** Brodsky, S.J. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). May 1987. Contract AC03-76SF00515. 13p. (CONF-870165—8). NTIS, PC A02. File Number DE87011593.

From Workshop on electronuclear physics with internal targets; Stanford, CA, USA (5 Jan 1987).

The exclusive channels in electroproduction are discussed. The study of color transparency, the formation zone, and other novel aspects of QCD by measuring exclusive reactions inside nuclear targets is covered. Diffractive electroproduction channels are discussed, and exclusive nuclear processes in QCD are examined. Non-additivity of nuclear structure functions (EMC effect) is also discussed, as well as jet coalescence in electroproduction. (LEW)

**38198** (UCRL—92902) **An experiment to measure the electron neutrino mass using a cryogenic tritium source.** Fackler, O.; Jeziorski, B.; Kolos, W.; Monkhorst, H.; Mugge, M.; Sticker, H.; Szalewicz, K.; White, R.M.; Woerner, R. (Lawrence Livermore National Lab., CA (USA); Rockefeller Univ., New York (USA); Warsaw Univ. (Poland); Waterloo Univ., Ontario (Canada); Florida Univ., Gainesville (USA); Fermi National Accelerator Lab., Batavia, IL (USA)). 25 Jun 1985. Contract W-7405-ENG-48. 11p. (CONF-8504305—1). NTIS, PC A02. File Number DE87009587.

From Recontres de Moriond conference on weak interactions; Les Arcs, France (23 Apr 1985).

An experiment has been performed to determine the electron neutrino mass with the precision of a few eV by measuring the tritium beta decay energy distribution near the endpoint. Key features of the experiment are a 2 eV resolution electrostatic spectrometer and a high-activity frozen tritium source. It is important that the source have electronic wavefunctions which can be accurately calculated. These calculations have been made for tritium and the $HeT^+$ daughter ion and allow determination of branching fractions to 0.1% and energy of the excited states to 0.1 eV. The excited final molecular state calculations and the experimental apparatus are discussed. 4 refs., 5 figs.

**38199** **$E^+e^-\rightarrow W^+W^-$ in $E_6$ models with additional neutral gauge bosons.** Rizzo, T.G. (Ames Laboratory and Department of Physics, Iowa State University, Ames, Iowa 50011). *Physical Review [Section] D: Particles and Fields;* **36**: No. 3, 713-718(1 Aug 1987). Contract W-7405-ENG-82.

We examine the influence of additional neutral gauge bosons (Z'), which can exist in $E_6$ models, on the total ($\sigma$) and differential ($d\sigma/dcos\theta$) sections for $e^+e^-\rightarrow W^+W^-$. Four different models of this kind with additional Z's are examined. We find that this process is quite sensitive to the existence of these new gauge bosons even if they are very heavy (M/sub Z//sub '/>1/2—1 TeV) and the Z-Z' mixing is small (sinphi≤0.025). The four models are distinguishable from each other and the standard model using data from either $\sigma$ or $d\sigma/d\cos\theta$ measurements.

**38200** **Branching, geometrical scaling, and Koba-Nielsen-Olesen scaling.** Chen, W.R.; Hwa, R.C. (Institute of Theoretical Science and Department of Physics, University of Oregon, Eugene, Oregon 97403). *Physical Review [Section] D: Particles and Fields;* **36**: No. 3, 760-764(1 Aug 1987).

The phenomenon of Koba-Nielsen-Olesen scaling up to about 100 GeV in c.m. energy in pp collision is described in a branching model supplemented by impact-parameter smearing with geometrical scaling as an essential input. A high-accuracy fit of all data points from CERN ISR is achieved by use of only one parameter, which relates the particle productivity to hadron opacity at each impact parameter. It is deduced that the average number of initial clusters is between 4 and 5, depending upon the energy.

**38201 Charge asymmetry of the nuclear interaction and neutron-neutron scattering parameters.** de Teramond, G.F.; Gabioud, B. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94305). *Physical Review* [*Section*] *C: Nuclear Physics;* **36**: No. 2, 691-701(Aug 1987). Contract AC03-76SF00515.

Analyses of bound systems and low-energy scattering experiments give clear evidence of a departure from charge symmetry in the nuclear interaction. Furthermore, this effect could be enhanced in a nuclear medium thereby solving the Nolen-Schiffer anomaly observed in mirror nuclei. Since the extraction of the n-n scattering parameters is tied to the theoretical analysis of particular nuclear reactions, we have examined some theoretical treatments and approximations used in the study of the reaction $\pi^- d \to \gamma nn$ which is ideal for this purpose. In particular, we consider the neutron-neutron enhancement in higher n-n partial waves by introducing a simplified approach to the eigenamplitude and multipole expansions. We also give a description of the methods used in the calculation of the final state interactions in the $^1S_0$ n-n state to determine the low-energy n-n scattering parameters.

**38202 Fate of the m/sub b//m/sub tau/ mass relation in superstring theories.** Holman, R.; Reiss, D.B. (Fermi National Accelerator Lab., Batavia, IL, USA. Astrophysics Theory Group; Minnesota Univ., Minneapolis, USA. School of Physics and Astronomy). *Nuclear Physics* [*Section*] *B;* **288**: No. 1, 152-172(22 Jun 1987).

We consider the low energy limit of the E/sub 8/xE/sub 8/' heterotic superstring theory compactified on non-simply connected Calabi-Yau manifolds. We then determine what the consequences are of requiring that the m/sub b//m/sub tau/ mass relation be due to a Clebsch-Gordan relation as it is in traditional grand unified models.

**38203 Polarization density matrix for heavy Qanti Q production in hadron colliders.** Lee, S.C. (Fermi National Accelerator Lab., Batavia, IL, USA). *Physics Letters* [*Section*] *B;* **189**: No. 4, 461-465(14 May 1987).

We derive the polarization density matrix for the heavy quark-antiquark pair produced by gluon fusion or quark annihilation. These formulas are applied to find the angular correlations of the W/sup +/W/sup -/ pairs from ultra-heavy Qanti Q decays.

**38204 Indirect searches for ultra-heavy quarks in rare decays.** Bigi, I.I.; Wakaizumi, S. (Stanford Linear Accelerator Center, CA, USA; Hiroshima Univ., Japan. Dept. of Physics). *Physics Letters* [*Section*] *B;* **188**: No. 4, 501-505(23 Apr 1987). Contract AC03-76SF00515.

Existing accelerators will not allow the direct discovery of quarks with masses > or approx.M/sub w/. However such heavy objets can - via loop effects - have a significant impact on some rare decays, mainly of K and B mesons. Using a hierarchical model for the KM matrix we analyze the prospects for such an indirect search for ultra-heavy quarks.

**38205 Neutrino emission by the pair, plasma, and photo processes in the Weinberg-Salam model.** Schinder, P.J.; Schramm, D.N.; Wiita, P.J.; Margolis, S.H.; Tubbs, D.L. (Chicago Univ., IL; Pennsylvania Univ., Philadelphia; Aerospace Corp., Los Angeles, CA; Los Alamos National Lab., NM). *Astrophysical Journal;* **313**: 531-542(Feb 1987).

The results of numerical integrations of the rates and emissivities of the photo, pair, and plasma neutrino emission mechanisms in the Weinberg-Salam theory of the weak interaction are presented. The range of densities from 10 to 10 to the 14th g/cu cm and the temperature range from 10 to the 8th to 10 to the 11th K are considered. Fitting formulas, similar to those provided by Beaudet et al. (1967), which reproduce the authors' numerical result for the total emissivity to within 20 percent in the temperature range from 10 to the 8.2 to 10 to the 11th K, are presented. 26 references.

**38206 (DESY-L-Trans—317) Nonleptonic decays of a charmed baryon in the generalized chiral Lagrangian method.** Kalinovskij, Yu.L.; Pervushin, V.N.; Sarikov, N.A. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.); Gomel'skij Politekhnicheskij Inst. (Byelorussian SSR); Joint Inst. for Nuclear Research, Dubna (USSR); AN Uzbekskoj SSR, Tashkent. Inst. Yadernoj Fiziki). Jan 1987. Translation of JINR-P—2-86-308. 6p. NTIS, PC E07; Available from NTIS as TIB/B87-07040.

Translated from Russian.

The generalized phenomenological chiral Lagrangian method including spin-1 mesons together with pseudoscalar mesons and baryons is proposed for describing the nonleptonic decays of charmed baryons. This method (in comparison with the approaches based on quark models) allowed one to calculate the amplitudes of charmed baryon (particularly many-body) decay modes in a simpler way. The probabilities for the decays of λ/sup +/-baryon λ/sup +/ -> 1/2/sup +/ + 0/sup -/, λ' -> 1/2/sup +/ + 0/sup -/ + 0/sup -/ and λ/sup +/ -> 1/2/sup +/ + 1/sup -/ have been calculated, for which experimental values have been obtained for the first time. The theoretical value of probability ratio for λ/sup +/ -> λπ/sup +/ and λ/sup +/ -> pK/sup +/ is in agreement with its experimental value.

**38207 Physics simulations at high energy.** Barger, V.; Gottschalk, T.; Halzen, F. (eds.). Singapore; World Scientific Publishing Co. Pte. Ltd. (1987). 663p. (DOE/ER/40278—1; CONF-8605163—). World Sci. Publ. Co., Box 128, Farrer Rd., Singapore 9138. File Number TI87010800. Contract FG02-86ER40278.

From Workshop on physics simulation at high energies; Madison, WI, USA (5 May 1986).

Separate abstracts were prepared for 44 papers in these proceedings. (LW)

**38208 (DESY-L-Trans—315) Anomalies in radiation decays of charmed mesons.** Kalinovskij, Yu.L.; Pervushin, V.N.; Sarikov, N.A. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.); Gomel'skij Politekhnicheskij Inst. (Byelorussian SSR); AN Uzbekskoj SSR, Tashkent. Inst. Yadernoj Fiziki). Dec 1986. Translation of JINR-P—2-86-307. 11p. NTIS, PC E07; Available from NTIS as TIB/B87-04530.

Translated from Russian.

The amplitudes of the charmed meson decays D->O/sup -/+O/sup -/+γ and F->O/sup -/+O/sup -/+γ have been calculated in the framework of SU(4)center dotSU(4) - chiral Lagrangians with anomalies. It will be shown that E1-transitions do not exist in this approach.

**38209 Status of electroweak theory for heavy quark decays and CP violation.** Chau, L.L. (California Univ., Davis; Brookhaven National Lab., Upton, NY). pp 450-470 of Weak and electromagnetic interactions in nuclei. Proceedings. Klapdor, H.V. (ed.). Berlin, Germany, F.R.; Springer (1986). (CONF-860741—).

From International symposium on weak and electromagnetic interactions in nuclei; Heidelberg, F.R. Germany (1 Jul 1986).

The phenomena of quark mixing in weak interaction are described. The current experimental status of the mixing matrix, charm and beauty particle decays, and CP violations are reported. Future interesting experiments are pointed out, especially in the event that higher generations of quarks exist. 555 figures.

**38210 Constraints on general SU(2)/sub L/ x SU(2)/sub R/ x U(1) electroweak models from nuclear beta decay.** Herczeg, P. (Los Alamos National Lab., NM). pp 528-533 of Weak and electromagnetic interactions in nuclei. Proceedings. Klapdor, H.V. (ed.). Berlin, Germany, F.R.; Springer (1986). (CONF-860741—).

From International symposium on weak and electromagnetic interactions in nuclei; Heidelberg, F.R. Germany (1 Jul 1986).

Here we shall analyze the implications of beta-decay experiments for more general versions of SU(2)/sub L/ x SU(2)/sub R/ x U(1) models, including the most general one which allows for CP-violation, unequal left- and right-handed quark mixing angles, and

mixing in the leptonic sector. For each scenario we shall compare the constraints on the pertinent parameters from beta-decay measurements with the constraints provided on them by other data. 555 figures.

## 6453 Particle Invariance Principles And Symmetries

*REFER ALSO TO CITATION(S) 38078, 38209, 38228, 38283*

**38211 Phenomenological clues for discrete symmetries in superstring theories.** Branco, G.C.; Geng, C.Q.; Marshak, R.E.; Xue, P.Y. (Physics Department, Virginia Polytechnic Institute and State University, Blacksburg, Virginia 24061). *Physical Review [Section] D: Particles and Fields;* **36**: No. 3, 928-931(1 Aug 1987).

It is shown that within the framework of the $E_8 \times E_8$ heterotic superstring if the Yukawa superpotential of the effective four-dimensional $E_8$ gauge theory is required to lead in a natural way to (i) no rapid proton decay, (ii) Fritzsch-type quark and charged-lepton mass matrices, and (iii) naturally small neutrino masses generated through radiative corrections, then for three generations a minimal $Z_8 \times Z_6$ symmetry is required. A minimal model based on this discrete symmetry is suggested and discussed. The generalization for more than three generations is analyzed.

**38212 Algebraic approach to scattering and the Euclidean connection.** Alhassid, Y. (Yale Univ., New Haven, CT). pp 29-36 of Symmetries in science II. Gruber, B.; Lenczewski, R. (eds.). New York, NY; Plenum Press (1986). Contract AC02-76ER03074.

Starting from a dynamical group describing a scattering problem the author explains how the S-matrix can be calculated algebraically through the technique of Euclidean connection. The S-matrix corresponding to the dynamic group SO(3,2) is constructed explicitly and provides a realistic model for the analysis of heavy-ion collisions. 13 references.

**38213 General Dynkin indices and their applications.** Okubo, S. (Univ. of Rochester, NY). pp 419-428 of Symmetries in science II. Gruber, B.; Lenczewski, R. (eds.). New York, NY; Plenum Press (1986). Contract AC02-76ER13065.

The notion of general Dynkin indices for representations of simple Lie algebras is defined and their various applications in self-conjugate representations, Clebsch-Gordan decomposition, decomposition of tensor-power representations, and trace identities are discussed. 29 references.

## 6454 Field Theory

**38214 (ANL-HEP-CP—87-15) Unorthodox lattice fermion derivatives and their shortcomings.** Bodwin, G.T.; Kovacs, E.V. (Argonne National Lab., IL (USA); Illinois Univ., Chicago (USA). Dept. of Physics). 10 Mar 1987. Contract W-31109-ENG-38. 21p. (CONF-870121—10; UIC—87-14). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011482.

From Meeting of the Division of Particles and Fields of the American Physical Society; Salt Lake City, UT, USA (14 Jan 1987).

We discuss the DWY (Lagrangian), Quinn-Weinstein, and Rebbi proposals for incorporating fermions into lattice gauge theory and analyze them in the context of weak coupling perturbation theory. We find that none of these proposals leads to a completely satisfactory lattice transcription of fully-interacting gauge theory.

**38215 (BNL—39747) Monte Carlo algorithms for lattice gauge theory.** Creutz, M. (Brookhaven National Lab., Upton, NY (USA)). May 1987. Contract AC02-76CH00016. 35p. (CONF-8705129—1). NTIS, PC A03/MF A01; GPO Dep. File Number DE87010045.

From Workshop on lattice gauge theory using parallel processors; Beijing, China (21 May 1987).

Various techniques are reviewed which have been used in numerical simulations of lattice gauge theories. After formulating the problem, the Metropolis et al. algorithm and some interesting variations are discussed. The numerous proposed schemes for including fermionic fields in the simulations are summarized. Langevin, microcanonical, and hybrid approaches to simulating field theories via differential evolution in a fictitious time coordinate are treated. Some speculations are made on new approaches to fermionic simulations.

**38216 (DOE/ER/40272—37) Curvature of Super $\mathrm{DiffS}^1/\mathrm{S}^1$.** Oh, P.; Ramond, P. (Florida Univ., Gainesville (USA). Dept. of Physics). 6 Apr 1987. Contract FG05-86ER40272. 12p. (UFTP—87-9). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011205.

Motivated by the work of Bowick and Rajeev, we calculate the curvature of the infinite-dimensional flag manifolds $\mathrm{DiffS}^1/\mathrm{S}^1$ and Super $\mathrm{DiffS}^1/\mathrm{S}^1$ using standard finite-dimensional coset space techniques. We regularize the infinity by zeta-function regularization and recover the conformal and superconformal anomalies respectively for a specific choice of the torsion.

**38217 (DOE/ER/40272—38) The superstring, $\mathrm{DiffS}^1/\mathrm{S}^1$, and holomorphic geometry.** Harari, D.; Hong, Deog Ki; Ramond, P.; Rodgers, V.G.J. (Florida Univ., Gainesville (USA). Dept. of Physics). Apr 1987. Contract FG05-86ER40272. 29p. (UFTP—87-10). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87011206.

We incorporate superstrings into the non-perturbative formulation of string field theories based on Kahler geometry recently proposed by Bowick and Rajeev. The string field is conjectured to be the Kahler potential of loop space, its equation of motion given by the vanishing of the curvature of a product bundle constructed over a graded $\mathrm{DiffS}^1/\mathrm{S}^1$, as required for reparametrization invariance of the theory. We find that bosonic and fermionic loops in a Minkowski background solve the equation for the Kahler potential only in ten dimensions. We use geometric quantization techniques to calculate the curvature of the superholomorphic vector bundle, since they emphasize the role of the complex geometry, and flag manifold techniques to calculate the curvature of the line bundle over $\mathrm{SuperDiffS}^1/\mathrm{S}^1$.

**38218 (LBL—23122) The standard model and colliders.** Hinchliffe, I. (Lawrence Berkeley Lab., CA (USA)). Mar 1987. Contract AC03-76SF00098. 104p. (CONF-8607326—1; CONF-8607327—1). NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE87010260.

From Summer school on techniques in experimental high energy physics; St. Croix, Virgin Islands, U.S. (1 Jul 1986).

Some topics in the standard model of strong and electroweak interactions are discussed, as well as how these topics are relevant for the high energy colliders which will become operational in the next few years. The radiative corrections in the Glashow-Weinberg-Salam model are discussed, stressing how these corrections may be measured at LEP and the SLC. CP violation is discussed briefly, followed by a discussion of the Higgs boson and the searches which are relevant to hadron colliders are then discussed. Some of the problems which the standard model does not solve are discussed, and the energy ranges accessible to the new colliders are indicated. (LEW)

**38219 (PREPRINT—42) Heat transport and effective Landau Fermi liquid parameters in disordered interacting electronic systems.** Castellani, C.; Dicastro, C.; Strinati, G. (Rome Univ. (Italy)). Jan 1987. 14p. (ETN—87-99756). NTIS, PC A02/MF A01.

The renormalization of the specific heat and of the thermal diffusion coefficient due to the electron-electron interaction in the presence of disorder is determined by exploiting the skeleton structure of the heat response function in conjunction with the constraints originating from energy conservation (in the form of a Ward identity). This analysis leads to a generalization of the Wiede-

mann-Franz law near the localization transition with inclusion of interaction effects.

38220 (SLAC—312, pp 53-122) **Perturbative QCD: K-factors.** Field, R.D. (Univ. of Florida, Gainesville). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—). Contract FG05-86ER40272.

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

A pedagogical series of lectures on the perturbative applications of Quantum chromodynamics (QCD) is presented. Detailed calculations are made for $e^+e^-$ annihilations, deep inelastic scattering, and the Drell-Yan process. Emphasis is placed on the way one handles the infrared and mass singularities that arise in QCD. Two regularization schemes, massive glue and dimensional regularization, are studied. The origin and significance of K-factors is explained.

38221 (SLAC—312, pp 123-190) **Experimental tests of quantum chromodynamics.** Dorfan, J. (Stanford Univ., CA). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

A large body of data which relates to testing QCD is reviewed. The qualitative agreement between the data from a very wide range of processes and QCD is very impressive. This agreement is non-trivial in the sense that there exist no other theories or models which fit the data nearly as well. Quantitatively quarks have spin 1/2 and come in three colors and that gluons are vector-like particles. Direct experimental evidence for the triple gluon vertex is not seen; however most data are poorly fit (p anti p at CERN in particular) without such a contribution. Further indirect evidence comes from the fact that gluons appear to have a softer fragmentation function than quarks. Extracting the QCD scale LAMBDA is problematical and there exists no processes where a precise, non-controversial measurement can be made. All measurements seem entangled with either experimental or theoretical problems or both. However if it is assumed that all the measurements taken as a whole average out these problems, one is left reasonably satisfied with LAMBDA/sub QCD/ = 150 +/- 100 MeV.

38222 (SLAC—312, pp 643-666) **Superstring spectroscopy.** Peskin, M.E. (Stanford Univ., CA). Jan 1987. NTIS, PC A99/MF A01. File Number DE87009268. (CONF-860736—).

From 14. SLAC summer institute on particle physics; Stanford, CA, USA (28 Jul 1986).

A basic tutorial on string theory is presented. After a brief discussion of the properties of string theories the author gives 8 lessons on different aspects of the theories. These include: quantization, zero-point energy, bosonic strings, compactification, supersymmetry and symmetry groups.

38223 (SLAC-PUB—4251) **Introduction to string and superstring theory II.** Peskin, M.E. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Mar 1987. Contract AC03-76SF00515. 66p. (CONF-8606259—5). NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87010542.

From Theoretical Advanced Study Institute conference; Santa Cruz, CA, USA (23 Jun 1986).

Conformal field theory is reviewed, then conformal invariance is used to rederive the basic results on the embedding dimensionality for bosonic and fermionic strings. The spectrum of the bosonic and the computation of scattering amplitudes are discussed. The formalism used is extended to clarify the origin of Yang-Mills gauge invariance in the open bosonic string theory. The question of the general-coordinate gauge invariance of string theory is addressed, presenting two disparate viewpoints on this question. A brief introduction is then given of the reduction from the idealized string theory in 10 extended dimensions to more realistic solutions in which all but 4 of these dimensions are compactified. The state of knowledge about the space-time supersymmetry of the superstring from the covariant viewpoint is outlined. An approach for identifying possible 6-dimensional spaces which might represent the form of the compact dimensions is discussed, and the orbifold scheme of compactification is presented. 77 refs., 18 figs. (LEW)

38224 (SLAC-PUB—4316) **How to measure $\epsilon'/\epsilon$ with lattice QCD.** Sharpe, S.R. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Apr 1987. Contract AC03-76SF00515. 12p. (CONF-870390—3). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010312.

From 22. Recontres de Moriond: electroweak interactions and unified theories conference; Les Arcs, France (8 Mar 1987).

A pedagogical discussion is given of a lattice calculation of $\epsilon'$. The method is outlined, and preliminary results are presented. They suggest that $\epsilon'/\epsilon$ may be reduced from previous estimates by 60-70%.

38225 **Superconducting cosmic strings with massive fermions.** Hill, C.T.; Widrow, L.M. (Fermi National Accelerator Lab., Batavia, IL, USA; Chicago Univ., IL, USA. Astrophysics Center; Chicago Univ., IL, USA. Dept. of Physics). *Physics Letters [Section] B;* **189**: No. 1/2, 17-22(30 Apr 1987).

Fermions which couple to the fields comprising a Nielsen-Olesen vortex (cosmic string) can generally exist as massive bound modes on the string. If these fermions carry electromagnetic charge then the string will interact with external elecromagnetic fields in a manner significantly altered from the superconducting string scenario of Witten. The current in the string oscillates at a characteristic resonant frequency, proportional to $\mu$, and therefore produces a signature of narrow band radiation. We also give an accounting of the relevant anomalies responsible for fermionic superconducting strings.

38226 **Broken symmetry and the accelerated observer.** Hill, C.T. (Fermi National Accelerator Lab., Batavia, IL). pp 225-234 of Symmetries in science II. Gruber, B.; Lenczewski, R. (eds.). New York, NY; Plenum Press (1986).

Coordinate systems possessing horizons lead to certain ambiguities in the definition of a quantum field theory. They attempt to define a Hamiltonian, H/sub h/, which propagates the Schroedinger wave-functional of the quantum field theory in the accelerated observer's coordinate time. However, the singularity in the coordinate system on the horizon translates into ambiguities in the definition of the Hamiltonian density at the horizon and hence the Hamiltonian integral across the horizon. This coordinate system ambiguity represents a loss of information which must somehow be reincorporated to maintain consistency with the Minkowski space definition. However, in the literature this subtlety is generally ignored; one simply writes down an expression for the Hamiltonian with unspecified constraints upon the field configuration at the horizon. They refer to this naive prescription as the Rindler Hamiltonian. The ground state of the Rindler Hamiltonian is the Unruh vacuum and is seen to have lower energy than the Minkowski ground state. 11 references.

38227 **Double covering of diffeomorphisms for superstrings in generic curved space.** Ne'eman, Y.; Sijacki, D. (Tel Aviv Univ., Israel). pp 381-391 of Symmetries in science II. Gruber, B.; Lenczewski, R. (eds.). New York, NY; Plenum Press (1986). Contract FG05-85ER40200.

The embedding of the superstring in a generic curved space involves the use of world-spinors behaving according to the (infinite) unitary representations of SL(10,IR), the double-covering of the linear group on $R^{10}$. A supersymmetric extension is provided by the embedding of GL(10,IR) in the supergroup GQ(10, IR) whose flat limit reproduces Poincare supersymmetry. 23 references.

38228 **Light and group theory.** Sudarshan, E.C.G. (Univ. of Texas, Austin). pp 483-492 of Symmetries in science II. Gruber, B.; Lenczewski, R. (eds.). New York, NY; Plenum Press (1986). Contract FG05-85ER40200.

The transmission of light energy by complexes of pencils has been the subject of study in radiative transfer. In such studies they attempt to treat light as a collection of pencils, whose rays propagate rectilinearly. Since they can consider arbitrarily narrow pencils the radiant energy transfer can be reduced to integrodifferential equations. They must expect substantial modification of the whole framework of radiative transfer when quantum ideas are invoked. Light has the attribute of polarization, which cannot be satisfactori-

ly taken account of in conventional radiative transfer. Further since quantum theory of light demands that the wave aspect is essential, arbitrarily narrow pencils cannot be entertained; diffraction effects would then prevent rectilinear propagation. In the context of quantum electrodynamics they have still further elaborations to be made. The field strengths now become quantum operators. However, that the first fundamental theorem of quantum optics asserts that every quantum illumination can be expressed as an ensemble of coherent wave fields with a possibly singular ensemble density. Each coherent field can for many purposes be thought of as a classical wavefield. So at least as far as lossless transmission in passive media is considered, the full quantum electrodynamic behavior can be described as if they have an ensemble of classical wave fields. They rely on this fundamental theorem and treat optics as if it is classical wave optics with ensembles of wavefields as representative illuminations.

**38229 (DOE/ER/10638—7) Nuclear structure studies using the high resolution spectrometer at the Los Alamos Clinton P. Anderson Meson Physics Facility: Progress report, [1986-1987].** Hoffmann, G.W. (Texas Univ., Austin (USA). Dept. of Physics). Dec 1986. Contract AS05-80ER10638. 175p. NTIS, PC A08/MF A01; 1; GPO Dep. File Number DE87010304.

A major part of the work done this past year was associated with research conducted at the Los Alamos Clinton P. Anderson Meson Physics Facility (LAMPF) using the High Resolution Spectrometer (HRS) and the External Proton Beam (EPB). The research focussed on (1) providing p + nucleus data which test nonrelativistic and relativistic models of the medium energy proton + nucleus interaction, (2) providing (p,p) and (p,n) data which are to be analyzed to provide new nuclear structure information (both ground state and excited state), (3) providing nucleon + nucleon data to aid in the systematic study of the fundamental nucleon-nucleon interaction, (4) developing and improving the pA models themselves, and (5) initiating new experimental programs whose goals are to search for new phenomena in nuclear physics.

**38230 (DOE/ER/40150—15) CEBAF [Continuous Electron Beam Accelerator Facility] scientific program.** Gross, F. (Continuous Electron Beam Accelerator Facility, Newport News, VA (USA); College of William and Mary, Williamsburg, VA (USA). Dept. of Physics). 1986. Contract AC05-84ER40150. 37p. (CEBAF-PR—86-013; CONF-8606241—8). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87008672.

From 3. Continuous Electron Beam Accelerator Facility summer school; Newport News, VA, USA (23 Jun 1986).

The principal scientific mission of the Continuous Electron Beam Facility (CEBAF) is to study collective phenomena in cold (or normal) nucler matter in order to understand the structure and behavior of macroscopic systems constructed from nuclei. This document discusses in broad popular terms those issues which the CEBAF experimental and theoretical program are designed to address. Specific experimental programs currently planned for CEBAF are also reivewed. 35 refs., 19 figs. (DWL)

**38231 (KFK—4159) Annual report on nuclear physics activities. July 1, 1985-June 30, 1986.** Bueche, G.; Doll, P.; Friedrich, L. (eds.). (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Kernphysik). Dec 1986. 253p. NTIS, PC E17; Available from NTIS as TIB/B87-07048.

This report surveys the activities in basic research from July 1, 1985 to June 30, 1986 at the Institute for Nuclear Physics (IK) of the Kernforschungszentrum Karlsruhe. The research program of this institute comprises laser spectroscopy, nuclear reactions with light ions, neutron physics, neutrino physics and physics at medium and high energies.

**38232 (NP—7900796) Institute for Nuclear Study, University of Tokyo: Annual report, January-December 1984.** Yamaguchi, Yoshio. (Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study). 1984. 196p. NTIS (US Sales Only), PC A09/MF A01. File Number DE87900796.

The Institute for Nuclear Study was established in 1955, in order to promote research activities in nuclear and particle physics in our country. The facilities of the Institute are open to all researchers throughout the country. At present, four research divisions are active: the Low-Energy Division, the High-Energy Division, the Theory Division, and the Study Group for High-Energy Heavy-Ion Project.

**38233 (CONF-870501—6) Development of the Be(d,n) neutron source for cross-section investigations in the few-MeV energy range.** Smith, D.L.; Meadows, J.W.; Guenther, P.T.; Greenwood, L.R. (Argonne National Lab., IL (USA)). May 1987. Contract W-31109-ENG-38. 19p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011433.

From 6. ASTM-Euratom symposium on reactor dosimetry; Jackson Hole, WY, USA (31 May 1987).

Bombardment of thick Be-metal targets with several-MeV deuterons produces continuum-neutron fields which offer considerable potential for the development and validation of neutron-reaction cross sections. A facility based on this concept has been installed at the Argonne National Laboratory FNG accelerator. A description is provided of this facility and of the research studies which have been initiated to exploit its capabilities. Some technical considerations in the utilization of accelerator-produced continuum-neutron fields for reaction cross-section investigations are discussed. Results from several recent neutron-spectrum and integral cross-section measurements are presented, and the implications are reviewed. 13 refs., 8 figs.

**38234 (DOE/ER/40150—2) Electromagnetic studies in nuclei.** Gross, F. (Continuous Electron Beam Accelerator Facility, Newport News, VA (USA)). 1985. Contract AC05-84ER40150. 18p. (CEBAF—85-003; CONF-8503120—10). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87008679.

From Hadronic probes and nuclear interactions conference; Tempe, AZ, USA (11 Mar 1985).

This talk is devoted to a brief review of the experimental program for the new generation of multi-GeV continuous beam electron accelerator facilities. First, the kinematic variables used in electron scattering are reviewed, three experiments which are representative of previous work in this field are described, and some comparisons are made between electron and hadronic probes. The main part of the talk then describes seven experiments proposed for the future. These are concerned with the structure of light nuclei, the structure of mesons and baryons, the influence of the nuclear medium on hadronic interactions, and the weak interactions. 14 refs., 17 figs.

**38235 (DOE/ER/40150—9) Polarization in electron scattering experiments at CEBAF [Continuous Electron Beam Accelerator Facility].** Burkert, V. (Continuous Electron Beam Accelerator Facility, Newport News, VA (USA)). 1986. Contract AC05-84ER40150. 12p. (CEBAF-PR—86-008; CONF-860575—62). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87008677.

From 2. conference on particle and nuclear physics; Lake Louise, Canada (26 May 1986).

Some aspects of a tentative program for using high current polarized electron beams as well as solid state targets with high nucleon and deuteron polarization in nuclear physics experiments at CEBAF are briefly discussed. 14 refs., 4 figs.

38236 **The Los Alamos free atomic tritium beta decay experiment.** Knapp, D.A.; Bowles, T.J.; Browne, J.C.; Burritt, T.H.; Cohen, J.S.; Helffrich, J.A.; Maley, M.P.; Martin, R.L.; Robertson, R.G.H.; Wilkerson, J.F. (Los Alamos National Lab., Los Alamos, NM 87545). pp 57-62 of Neutrino mass and low energy weak interactions. Barger, V.; Cline, D. Teaneck, NJ; World Scientific Pub. Co. (1985).

An apparatus is under construction at Los Alamos to measure the beta spectrum of free tritium atoms and molecules. The tritium atoms decay in a gaseous windowless source and are analyzed by a Tret'yakov type toroidal field beta spectrometer. The ultimate sensitivity of the experiment to electron antineutrino mass is expected to be $<10$ eV.

## 6513 Nuclear Properties And Reactions, A=6-19, Experimental

38237 **(BNL—39723) Studies of hypernuclei by associated production.** Chrien, R.E. (Brookhaven National Lab., Upton, NY (USA)). 1987. Contract AC02-76CH00016. 10p. (CONF-870413—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010448.

From 11. international conference on particles and nuclei; Kyoto, Japan (20 Apr 1987).

The effectiveness of the associated production, the ($\pi^+$,$K^+$) technique, for obtaining hypernuclear spectra across the whole periodic table is demonstrated. Binding energy spectra for hypernuclei of beryllium-9, carbon-12, carbon-13, oxygen-16, silicon-28, calcium-40, vanadium-51, and yttrium-89 were measured. The Low-Energy-Separated Beam I at the Brookhaven National Laboratory AGS was used with the Moby Dick spectrometer. A rate of 2 million pions per beam spill was used for targets of beryllium-9, carbon-12, water, silicon, and calcium. A rate of 10 million pions per beam spill was used for carbon-13, vanadium-51, calcium, and yttrium-89. The higher beam rates were necessary for the low cross sections for the ground states of heavier targets. All of the spectra for hypernuclei above the p-shell show the presence of a continuum apparently underlying the peaks of the bound state region. 4 refs., 5 figs., 1 tab.

38238 **(DOE/ER/03591—1) Experimental studies of nucleon-nucleon and pion-nucleus interactions at intermediate energies: Progress report, January 1, 1985-December 31, 1987.** (New Mexico State Univ., Las Cruces (USA)). 30 Jun 1987. Contract AS04-76ER03591. 50p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87012099.

This report summarizes the work on experimental research in intermediate energy nuclear and particle physics carried out by New Mexico State University in 1985-87. These studies have involved investigations of nucleon-nucleon and pion-nucleus interactions. They have been carried out at the LAMPF accelerator at the Los Alamos National Laboratory, at the SIN laboratory near Zurich, Switzerland, and at the TRIUMF accelerator in Vancouver, Canada. 86 refs., 5 figs.

38239 **(LBL—23570) Probing the direct step of relativistic heavy ion fragmentation: ($^{12}$C, $^{11}$B+p) at 2.1 GeV/nucleon with C and $CH_2$ targets.** Webb, M.L. (Lawrence Berkeley Lab., CA (USA)). Jun 1987. Contract AC03-76SF00098. 116p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE87011914.

Relativistic heavy ion collisions may be classified as central (and near central), peripheral, and grazing with each collision type producing different proton and other charged projectile fragment scattering mechanisms and characteristics. This report focuses on peripheral and grazing collisions in the fragmentation of Carbon-12 into Boron-11 and a proton, testing models of the kinetics involved in this reaction. The data were measured at the Heavy Ion Superconducting Spectrometer (HISS) at Lawrence Berkeley Laboratory and include excitation energy for the p/Boron-11 pair, and rapidity versus transverse momentum for protons and Boron-11. 58 refs., 35 figs., 8 tabs. (DWL)

38240 **Electroexcitation of discrete levels in /sup 12/C and /sup 13/C at high momentum transfers.** Hicks, R.S.; Huffman, R.L.; Lindgren, R.A.; Peterson, G.A.; Plum, M.A.; Button-Shafer, J. (University of Massachusetts, Amherst, Massachusetts 01003). *Physical Review* [*Section*] *C: Nuclear Physics;* **36**: No. 2, 485-490(Aug 1987).

Form factors for transverse electron scattering from /sup 12/C and /sup 13/C have been determined for momentum transfers as high as q = 4.6 fm/sup -1/. Data are presented for the elastic (M1), 3.088 MeV (E1), and 9.50 MeV (M4) transitions in /sup 13/C, and for the 15.11 MeV (M1), 16.11 MeV (E2), and 16.58 MeV (M2) transitions in /sup 12/C. It is found that calculations in the lowest-order shell-model space fail to account for the measured q dependences of E1, M1, and E2 form factors beyond q = 2 fm/sup -1/. On the other hand, form factor shapes observed for M2 and M4 multipoles are satisfactorily described to q = 4 fm/sup -1/ within the minimal 1h-dash-barω configuration space.

38241 **(p-arrow-right,n) reaction on carbon isotopes at E/sub p/ = 160 MeV.** Rapaport, J.; Wang, D.; Carr, J.A.; Petrovich, F.; Foster, C.C.; Goodman, C.D.; Gaarde, C.; Larsen, J.; Goulding, C.A.; Taddeucci, T.N.; and others. (Ohio University, Athens, Ohio 45701). *Physical Review* [*Section*] *C: Nuclear Physics;* **36**: No. 2, 500-512(Aug 1987).

Differential cross sections and analyzing powers for the (p-arrow-right,n) reaction on carbon isotopes have been measured for angles up to θ/sub lab/ = 50° using 160 MeV protons. The angular distributions for the stronger transitions are compared with the results of distorted-wave impulse approximation calculations which utilize transition densities from existing shell model calculations. The total observed Gamow-Teller strength is also compared with the shell model predictions. In addition, the shapes of these angular distributions are discussed emphasizing decomposition into longitudinal, transverse, and non-normal-parity-transfer components. Some comparisons of the present (p,n) data with corresponding (p,p') data and with other relevant (p,n) data are also made.

38242 **Electromagnetic transitions in hypernuclei.** Chrien, R.E. (Brookhaven National Lab., Upton, NY). pp 587-591 of Weak and electromagnetic interactions in nuclei. Proceedings. Klapdor, H.V. (ed.). Berlin, Germany, F.R.; Springer (1986). (CONF-860741—).

From International symposium on weak and electromagnetic interactions in nuclei; Heidelberg, F.R. Germany (1 Jul 1986).

## 6514 Nuclear Properties And Reactions, A=20-38, Experimental

38243 **Limits on likesign dilepton production in ν/sub μ/ interactions.** Baker, N.J.; Connolly, P.L.; Kahn, S.A.; Murtagh, M.J.; Palmer, R.B.; Samios, N.P.; Tanaka, M.; Baltay, C.; Bregman, M.; Hibbs, M. (Brookhaven National Lab., Upton, NY 11973). pp 1-10 of Neutrino mass and low energy weak interactions. Barger, V.; Cline, D. Teaneck, NJ; World Scientific Pub. Co. (1985).

We have searched for the production of likesign dilepton events (ν/sub μ/ + Ne → μ/sup -/ + e/sup -/ + ...) in a wide-band neutrino beam at FNAL using the 15' bubble chamber. The authors observe no signal above the background arising from conventional sources. We set 90% confidence level upper limits for the production rates of (ν/sub μ/ + Ne → μ/sup -/ + e/sup -/ + ...) /(ν/sub μ/ + Ne → μ/sup -/ + ...) ≦ 8 * 10/sup -5/ and (μ/sub ν + Ne → μ/sup -/ + e/sup -/ + ...)/(ν/μNe → μ/sup -/ + E/sup +/ + ..) ≦ 6 * 10/sup -2/.

## 6516 Nuclear Properties And Reactions, A=59-89, Experimental

**38244 (DOE/ER/40048—192) Statistical GDR [Giant Dipole Resonances] decay of highly excited states of $^{63}$Cu.** Kicinska-Habior, M.; Snover, K.A.; Gossett, C.A.; Behr, J.A.; Feldman, G.; Glatzel, H.K.; Gundlach, J.H.; Garman, E.F. (Washington Univ., Seattle (USA). Nuclear Physics Lab.). [1987]. Contract AC06-81ER40048. 63p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87009711.

Continuum γ-ray spectra from decays of $^{63}$Cu formed at initial excitation energies of 22.5 to 77.4 MeV and maximum spin up to 40 h-bar, using $^{4}$He + $^{59}$Co, $^{6}$Li + $^{57}$Fe, $^{12}$C + $^{51}$V, and $^{18}$O + $^{45}$Sc entrance channels, have been measured and analyzed. The parameters of the GDR strength function have been extracted using the statistical code CASCADE in a nonlinear least-squares fitting routine. Except for the cases of $^{4}$He and $^{6}$Li at the highest bombarding energies, which show evidence for nonstatistical effects, spectra are well-reproduced by statistical calculations. The mean energy and strength of the giant dipole resonance built on excited states of $^{63}$Cu are close to the ground-state values, while the width varies smoothly from ~5 MeV for the ground-state GDR up to 10.6 +- .6 MeV in the temperature range up to 1.9 MeV and mean spin in the range 0 to 23 h-bar. The large range of energies studied permitted different level density formulations to be tested. Measured spectra from $^{6}$Li + $^{98}$Mo and $^{6}$Li + $^{181}$Ta at E/sub lab/($^{6}$Li) = 36 MeV show a strong nonstatistical enhancement at high γ-ray energies. 52 refs., 14 figs., 3 tabs.

**38245 (HEDL-SA—3530) 1986 evaluation of delayed-neutron emission probabilities.** Mann, F.M. (Hanford Engineering Development Lab., Richland, WA (USA)). 13 Aug 1986. Contract AC06-76FF02170. 12p. (CONF-8609161—3). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010726.

From Meeting on delayed neutrons; Birmingham, UK (15 Sep 1986).

Delayed-neutron data are being compiled in preparation for a new ENDF/B evaluation of delayed-neutron data. An evaluation of the probability of delayed-neutron emission, Pn, for 85 precursors using data published through the end of 1985 has been performed using preliminary ENDF/B fission yields and decay data. The evaluation, differences from the 1984 Pn evaluation, and implications of the new evaluation will be discussed. 33 refs., 5 figs.

**38246 Microscopic distorted-wave approximation study of low-energy nucleon scattering from /sup 89/Y.** Mellema, S.; Petler, J.S.; Finlay, R.W.; Dietrich, F.S.; Carr, J.A.; Petrovich, F. (Department of Physics, University of Wisconsin-Madison, Madison, Wisconsin 53706). *Physical Review [Section] C: Nuclear Physics;* **36**: No. 2, 577-584(Aug 1987).

New differential cross section data for inelastic neutron scattering to the first three excited states of /sup 89/Y at E/sub n/ = 11 MeV are studied using a microscopic folding model and three energy- and density-dependent effective interactions. Results are also presented for the corresponding transitions in inelastic proton scattering at 14.7, 24.5, and 61.2 MeV. Transition densities were obtained from a combination of available inelastic electron-scattering data and theoretical considerations. The calculated angular distributions provide a reasonable description of the experimental data for the predominantly quadrupole (ΔJ = 2), (1/2$^-$→(3/2$^-$ (E/sub x/ = 1.509 MeV) and (1/2$^-$→(5/2$^-$ (E/sub x/ = 1.745 MeV) transitions in the target. It is shown that the neutron scattering data for these two transitions are sensitive to the shape differences in the transition densities suggested by theory and electron scattering. The theoretical results for the predominantly ΔJ = 5, (1/2$^-$→(9/2$^+$ (E/sub x/ = 0.909 MeV) transition significantly underestimate the proton and neutron scattering cross sections at E/sub p/<25 MeV and E/sub n/ = 11 MeV, but provide a reasonable description of the proton scattering data for this transition at E/sub p/ = 61.2 MeV.

**38247 Neutron capture cross sections for $^{86}$Sr and $^{87}$Sr at stellar temperatures.** Bauer, R.W.; Mathews, G.J.; Becker, J.A.; Howe, R.E.; Ward, R.A. (Lawrence Livermore National Lab., CA). pp 984-985 of Weak and electromagnetic interactions in nuclei. Proceedings. Klapdor, H.V. (ed.). Berlin, Germany, F.R.; Springer (1986). (CONF-860741—). Contract W-7405-ENG-48.

From International symposium on weak and electromagnetic interactions in nuclei; Heidelberg, F.R. Germany (1 Jul 1986).

**38248 Ultralow background searches for ββ-decay, cold dark matter and solar axions.** Avignone, F.T. III; Miley, H.S.; Ahlen, S.P.; Brodzinski, R.L.; Reeves, J.H.; Dimopolous, S.; Starkman, G.D.; Drukier, A.K.; Gelmini, G.; Spergel, D.N. (South Carolina Univ., Columbia; Boston Univ., MA; Battelle Pacific Northwest Labs., Richland, WA; Stanford Univ., CA; Harvard-Smithsonian Center for Astrophysics, Cambridge, MA). pp 676-680 of Weak and electromagnetic interactions in nuclei. Proceedings. Klapdor, H.V. (ed.). Berlin, Germany, F.R.; Springer (1986). (CONF-860741—).

From International symposium on weak and electromagnetic interactions in nuclei; Heidelberg, F.R. Germany (1 Jul 1986).

An ultralow background Ge detector in the Homestake gold mine is applied to searches for O$\nu$ ββ-decay, cold dark matter candidates and invisible axions from the sun. A large body of low background Ge data imply <m/sub ν/>< or approx.2.3 eV. Particles with spin independent $Z^0$ exchange interactions and masses between 20 GeV and 5 TeV are excluded as dominant in the galactic halo. Finally, axions with F/2x/sub e/'< or approx.0.5x10$^7$ GeV are also ruled out. 555 figures.

**38249 A /sup 82/Se double Beta decay experiment.** Moe, M.K.; Hahn, A.A.; Elliott, S.R. (Univ. of California, Irvine, CA 92717). pp 156-167 of Neutrino mass and low energy weak interactions. Barger, V.; Cline, D. Teaneck, NJ; World Scientific Pub. Co. (1985).

In 70 days of live time with an enriched /sup 82/Se source in a TPC, 30 double-beta-like events have survived cuts imposed to eliminate known backgrounds. The identity of these events is still undetermined. They are consistent with a /sup 82/Se half life of > 4.1 x 10/sup 19/ years at the 90% confidence level. The absence of events near the 3.0 MeV endpoint corresponds to a limit on the neutrinoless half life of > 1.4 x 10/sup 21/ years, also at 90% confidence. Data accumulation continues in an attempt to measure a definitive two-neutrino results, and extend the sensitivity to the neutrinoless mode.

**38250 Status of double beta decay of Ge.** Caldwell, D.O. (Univ. of California, Santa Barbara, CA 93106). pp 120-127 of Neutrino mass and low energy weak interactions. Barger, V.; Cline, D. Teaneck, NJ; World Scientific Pub. Co. (1985).

The search for neutrinoless double beta decay in /sup 76/Ge is being pursued vigorously world-wide, since the process tests lepton number conservation and could provide a measure of neutrino mass (m/sub ν/) and right-handed currents (RHC). Although greatly improved experiments are coming into operation, the lifetime limit for this decay is already about 10/sup 23/ years. The experimental situation is reviewed and the relation of lifetime results to m/sub ν/ and RHC is discussed.

## 6517 Nuclear Properties And Reactions, A=90-149, Experimental

**38251 (CONF-8706113—2) Angular momentum effects in subbarrier fusion.** Halbert, M.L.; Beene, J.R.; Hensley, D.C.; Honkanen, K.; Semkow, T.M.; Abenante, V.; Sarantites, D.G.; Li, Z. (Oak Ridge National Lab., TN (USA); Washington Univ., St. Louis, MO (USA)). Jun 1987. Contract AC05-84OR21400;AC02-76ER04052. 9p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87010892.

From 6. Adriatic international conference on nuclear physics; Dubrovnik, Yugoslavia (15 Jun 1987).

Angular-momentum distributions σ/sub l/ for the compound nucleus $^{164}$Yb were deduced from measurements of γ-ray multiplicity for all significant evaporation residues from fusion of $^{64}$Ni and $^{100}$Mo and $^{16}$O + $^{148}$Sm. At the lowest bombarding energies and the σ/sub l/ extend to higher l values than do predictions that include coupling of the principal inelastic channels, even if the coupling strengths are increased to match the experimental excitation function. Likewise, σ/sub l/ from an energy-dependent real potential fitted to the excitation function fails to reproduce the experimental σ/sub l/ distribution. No effects attributable to superdeformation were observed. 17 refs., 6 figs., 1 tab.

38252 **(GSI—87-3) Towards /sup 100/Sn: Studies on neutron-deficient even isotopes of tin.** Rathke, G.E. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.); Mainz Univ. (Germany, F.R.)). Feb 1987. 69p. NTIS, PC E09; Available from NTIS as TIB/B87-07044.

Neutron-deficient /sup 108,106,104/Sn isotopes were produced by heavy ion induced fusion reactions using high-intensity / sup 59/Ni beams from the UNILAC of the GSI. Their decay properties were studied by techniques of gamma and conversion electron spectroscopy employing the mass separator on-line to the UNILAC. Earlier information on the /sup 108/Sn -> /sup 108/In and /sup 106/Sn -> /sup 106/In decays was complemented and improved in the course of this work. The new nucleus /sup 104/Sn and its decay to excited states in /sup 104/In was identified and studied for the first time. These investigations yield the following results: the mass of /sup 104/Sn and of nuclei linked to it by alpha decay or proton radioactivity, /sup 108/Te, /sup 112/Xe and /sup 109/I, /sup 113/Cs, respectively were determined from the measured Q/sub EC/ value of /sup 104/Sn and the known mass value of /sup 104/In. These are nuclei very close or beyond the proton drip line. In addition, information on the quenching of the fast Gamow-Teller beta decay of the even neutron-deficient tin isotopes was obtained. This complements investigations on the N = 50 isotones /sup 94/Ru and /sup 96/Pd, and allows a systematic comparison of these transition strengths for nuclei near the doubly magic / sup 100/Sn. The spreading of the vertical stroke πg/sub 9/2//sup -1/ νg /sub 7/2/, 1/sup +/ > configuration over several states, due to residual interactions, and the centroid energies of these magnetic dipole states were determined for the corresponding odd-odd indium isotopes. (orig./HSI).

38253 **Observation of /sup 149/Tm decay to /sup 149/Er levels and β-delayed proton emission.** Toth, K.S.; Gilat, J.; Nitschke, J.M.; Wilmarth, P.A.; Vierinen, K.; Avignone III, F.T. (Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831). *Physical Review* [*Section*] *C: Nuclear Physics;* **36**: No. 2, 826-829(Aug 1987). Contract AC05-84OR21400.

With the use of an on-line isotope separator, /sup 149/Tm (T/sub 1/2/ = 0.9 +- 0.2 s) was identified in /sup 58/Ni bombardments of /sup 94/Mo. Seven γ rays were observed to follow the isotope's ($\beta^+$ + electron capture) decay, including the 111.3-keV transition known from /sup 149/Er/sup m/ isomeric decay to be the d/sub 3/2/ (111.3 keV)→s/sub 1/2/ (0.0 keV) γ ray in /sup 149/Er. In addition to the previously known levels at 111.3 (d/sub 3/2/) and 741.5 (h/sub 11/2/) keV in /sup 149/Er, our data establish three other excited states, at 907.4 ((5/2$^+$), 1066.2 ((7/2$^-$), and 1482.9 ((9/2$^-$, (11/2$^-$) keV. Coincidences observed between Er K x rays and protons in the A = 149 mass chain show that /sup 149/Tm is a β-delayed proton precursor.

38254 **Intermediate-mass fragments from nonbinary processes in the reaction of /sup 14/N on Ag at E/A = 35 MeV.** Bougault, R.; Horn, D.; Chitwood, C.B.; Fields, D.J.; Gelbke, C.K.; Klesch, D.R.; Lynch, W.G.; Tsang, M.B.; Kwiatkowski, K. (Atomic Energy of Canada Limited, Chalk River Nuclear Laboratories, Chalk River, Ontario, Canada K0J 1J0). *Physical Review* [*Section*] *C: Nuclear Physics;* **36**: No. 2, 830-833(Aug 1987).

Angular distributions of recoil nuclei were measured in coincidence with low-energy intermediate-mass fragments emitted in / sup 14/N-induced reactions on Ag at E/A = 35 MeV. The measured correlations are inconsistent with a purely binary reaction mechanism. The incomplete linear momentum transfer mechanism alone does not reproduce the data, which show evidence for emission of additional matter to the same side of the beam axis as the intermediate-mass fragment.

38255 **(DESY-L-Trans—318) Observation of π/sup 0/π/sup 0/-interference effect and size of neutral pion emission volume in π/sup -/Xe-interactions at 3.5 GeV/c.** Grishin, V.G.; Miller, K.; Pluta, J.; Pawliak, T.; Peryt, W.; Strugalski, Z. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.); Joint Inst. for Nuclear Research, Dubna (USSR); Politechnika Warszawska (Poland)). Feb 1987. Translation of JINR-P—1-86-585. 8p. NTIS, PC E07; Available from NTIS as TIB/B87-07041.

Translated from Russian.

Results from two-particle correlation studies are presented for π/sup 0/-mesons ejected in π/sup -/-Xe collisions at 3.5 GeV/c momentum. Interference correlations of π/sup 0/ mesons are found. Size of the region is determined, where the π/sup 0/ mesons are ejected from, and the π/sup 0/ generation time is estimated: r = 1.2 +- 0.3 fm, c/sub tau/ = 0.8 +- 0.4 fm. The results correspond to those obtained in hadron-hadron collisions but the values of r and c/sub tau/ are smaller than those for nucleus-nucleus collisions at such energies.

38259 **Can the neutrino mass be measured using /sup 163/Ho electron capture.** Bennett, C.L. (Lawrence Livermore National Lab., Livermore, CA 94550). pp 128-147 of Neutrino mass and low energy weak interactions. Barger, V.; Cline, D. Teaneck, NJ; World Scientific Pub. Co. (1985). Contract W-7405-ENG-48.

The safest limit on the neutrino mass comes from allowing the interference amplitude to be a free parameter in a fit to Springer's inner bremsstrahlung data while fixing the Q value to its

upper limit based on the results of the relative capture rates from F. Hartmann's data. Since /sup 163/Ho was the most promising electron capture candidate for a neutrino mass detector, it is unlikely that electron capture will ever compete with tritium beta decay in terms of sensitivity to neutrino mass. The best fundamental thing that can be said is that the limit of the difference in the mass of the neutrino and its anti-particle is smaller in absolute value than for any other fermion anti-fermion pair.

**38260 (GSI—87-7-Prepr.) Excitation energy sharing in / sup 86/Kr-induced quasielastic reactions on /sup 197/Au and /sup 208/PB between 10 and 18.2 MeV/u.** Sohlbach, H.; Freiesleben, H.; Braun-Munzinger, P.; Kohlmeyer, B.; Marinescu, M.; Puehlhofer, F.; Schneider, W.F.W.; Schuell, D. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.); Bochum Univ. (Germany, F.R.). Inst. fuer Experimentalphysik; State Univ. of New York, Stony Brook (USA). Dept. of Physics; Marburg Univ. (Germany, F.R.). Fachbereich 13 Physik). Jan 1987. 29p. NTIS, PC E07; Available from NTIS as TIB/B87-04776.

The average values and the fluctuations of the excitation energy sharing in quasielastic reactions are studied in two systems at various beam energies. The measured energy spectra of uniquely identified projectile-like nuclides reveal structures which are attributed to sequential decay of primary reaction products. The centroids and the widths of these structures can be reproduced consistently by means of a Monte Carlo simulation of sequential neutron emission within an isotopic chain only if the average value and the fluctuation of the excitation energy sharing are chosen properly for different reaction channels. Significant channel dependences of this energy sharing are observed for both systems and at all bombarding energies. The excitation energy is found to be allocated in both systems mainly to that fragment which picked up nucleons.

**38261 (LBL—23381) Energetic particle emission and linear momentum transfer in central collisions induced by 32.5 MeV/nucleon $^{16}O$ + $^{238}U$, $^{197}Au$.** Chan, Y.; Chavez, E.; Dacal, A.; Gazes, S.B.; Harmon, A.; Ortiz, M.E.; Plagnol, E.; Pouliot, J.; Stokstad, R.G. (Lawrence Berkeley Lab., CA (USA)). May 1987. Contract AC03-76SF00098. 12p. (CONF-870177—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011213.

From 5. Oaxtepec nuclear physics symposium; Oaxtepec, Mexico (5 Jan 1987).

Reaction kinetics of incomplete fusion reactions between heavy nuclei of Oxygen and Uranium and Oxygen and Gold are studied at 32.5 MeV bombarding energy to gain information about linear momentum transfer. It is found that the most probable linear momentum transfer is only about 75% of the beam momentum for these reactions. Binary massive transfer mechanisms and prompt nucleon emission are offered as explanations of this phenomena. It appears that nuclear mean field dynamics rather than nucleon-nucleon phenomenon dominate reaction kinetics at this bombarding energy. 5 refs., 8 figs.

**38262 Ir(t-arrow-right,α)Os reaction and implications for tests of supersymmetries.** Cizewski, J.A.; Burke, D.G.; Brown, R.E.; Sunier, J.W. (A. W. Wright Nuclear Structure Laboratory, Yale University, New Haven, Connecticut 06511). *Physical Review* [*Section*] *C: Nuclear Physics;* **36**: No. 2, 822-825(Aug 1987).

The (t-arrow-right,α) reactions have been studied on /sup 191,193/Ir targets. The analyzing power to the $2_3^+$ state in /sup 192/Os does not indicate single step d/sub 3/2/ proton transfer. Implications of this result for the theoretical interpretation of earlier (d,$^3$He) measurements in terms of supersymmetries are discussed.

**38263 Photon decay of giant resonances.** Bertrand, F.E.; Beene, J.R.; Halbert, M.L. (Oak Ridge National Lab., TN). pp 132-140 of Weak and electromagnetic interactions in nuclei. Proceedings. Klapdor, H.V. (ed.). Berlin, Germany, F.R.; Springer (1986). (CONF-860741—). Contract AC05-84OR21400.

From International symposium on weak and electromagnetic interactions in nuclei; Heidelberg, F.R. Germany (1 Jul 1986).

We have determined the total gamma-decay probability, the ground-state gamma branching ratio, and the branching ratios to a number of low-lying states as a function of excitation energy in $^{208}Pb$ to proportional to 15 MeV. The total yield of ground-state E2 gamma radiation in $^{208}Pb$ can only be understood if decay of compound states is considered. Other observations in $^{208}Pb$ include the absence of a significant branch from the giant quadrupole resonance (GQR) to the low-lying collective states at 2.6 MeV and 4.08 MeV, and a strong branch to a $3^-$ state at 4.97 MeV. 555 figures.

**38265 (ANL-HEP-CP—87-45) Semi-inclusive inelastic electron scattering from nuclei.** Berger, E.L. (Argonne National Lab., IL (USA)). 30 Apr 1987. Contract W-31109-ENG-38. 29p. (CONF-870165—9). NTIS, PC A03/MF A01; GPO Dep. File Number DE87011484.

From Workshop on electronuclear physics with internal targets; Stanford, CA, USA (5 Jan 1987).

A survey is presented of the physics of the electroproduction of hadrons from nuclear targets, eA → e'hX. Variables and structure functions are specified. The parton model description of electroproduction is summarized; fragmentation functions are defined and their properties are listed. Specific measurements are suggested. Predictions of the pion exchange model are presented for the nuclear dependence of eA → e'hX, including a discussion of the special subprocess eπ → e'π in which scattering occurs from the pion constituents of nuclei.

**38266 (CONF-8706142—1) An optical model analysis of $^{16}O$ + $^{12}C$ elastic scattering at E/A = 94 MeV.** Kobos, A.M.; Satchler, G.R. (Oak Ridge National Lab., TN (USA); Myrias Research Corp., Edmonton, Alberta (Canada)). 1987. Contract AC05-84OR21400. 13p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87010894.

From Supercomputing symposium; Calgary, Canada (15 Jun 1987).

An analysis of experimental data for $^{16}O$ + $^{12}C$ elastic scattering at an $^{16}O$ bombarding energy of 1503 MeV is presented, including the use of "model-independent" and "semi-model-independent" techniques. The data unambiguously indicate an optical potential whose real part is approximately 80 MeV deep in the interior, but which is more attractive in the surface region than that given by a folding model with a "realistic" nucleon-nucleon interaction. 6 refs., 3 figs., 1 tab.

**38267 (DOE/ER/05126—307) Nonperturbative extension of the light-front QCD.** Namyslowski, J.M. (Maryland Univ., College Park (USA). Dept. of Physics and Astronomy). Jan 1987. Contract AS05-76ER05126. 43p. (ORO—5126-307). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87007376.

An approximate account of the soft field fluctuations in hadrons is proposed in the framework of the light-front dynamics. Hadrons are considered as bound systems of constituent quarks and gluons which acquire running masses due to the interaction with soft fields. The lower bounds on the virtuality $p^2$ = p/sub μ/p/sup μ/ of the single hard particle give upper bounds on the quark and gluon masses: m/sub quark/(p) < 331 MeV, and m/sub gluon/(p)

< 493 MeV. The state of hadron with momentum P/sub $\mu$/ has virtuality $D_0 = M^2$ - P/sub $\mu$/P/sup $\mu$/, where M is the hadron mass. In the n-constituent state, each constituent has average virtuality $D_0/n$ which is bounded from below. This bound gives the upper bounds on the number n of constituents in the state with virtuality $D_0$: n/sub quark/ < absolute value of $D_0/(331\ MeV)^2$, n/sub gluon/ < absolute value of $D_0/(493\ MeV)^2$. For the hadron's bound state equation we find the n-body propagator and the irreducible kernels in terms of the Jacobi relativistic, relative momenta. 28 refs., 8 figs., 8 tabs.

38268 **(DOE/ER/40048—19-N7) Influence of six-quark bags on electron scattering.** Miller, G.A. (Washington Univ., Seattle (USA). Dept. of Physics). Jan 1987. Contract AC06-81ER40048. 4p. (CONF-870165—7). NTIS, PC A02. File Number DE87011082.

From Workshop on electronuclear physics with internal targets; Stanford, CA, USA (5 Jan 1987).

Possible signatures of the presence of nuclear six-quark bags are discussed. 8 refs., 1 tab.

38269 **(DOE/ER/40048—20-N7) The EMC effect and related issues.** Jung, Hong; Miller, G.A. (Washington Univ., Seattle (USA). Dept. of Physics). 1987. Contract AC06-81ER40048. 14p. (CONF-8703136—3). NTIS, PC A02. File Number DE87011081.

From Elementary structure of materials; Les Houches, France (24 Mar 1987).

The nucleon (plus pion) explanation of the EMC effect is investigated, and shown to be reasonable. The subjects of dynamical rescaling and the related Drell-Yan process are also discussed.

38270 **(DOE/ER/40068—3) [Intermediate/high energy probes and the structure of nuclei]: Final report.** Vary, J.P. (Iowa State Univ. of Science and Technology, Ames (USA)). 10 Feb 1987. Contract AC02-82ER40068. 26p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87010248.

We propose to expand our efforts to develop a theoretical framework for the quark and gluon structure of nuclei. We will continue to refine the ingredients of our current model, the quark cluster model (QCM), and initiate an ambitious program in the non-perturbative solution of field theories. We propose to first solve non-trivial model field theories in the strong coupling regime using the discretized light front quantization (DLFQ) scheme of Pauli and Brodsky. The goal of these initial efforts will be to develop fast and accurate methods for taking the continuum limit as well as to elucidate the consequences of spontaneous symmetry breaking within the DLFQ method. Subsequent efforts will address QCD in low dimensionality with the purpose of extracting non-perturbative predictions for quark and gluon amplitudes in few baryon systems. Simultaneously with this new initiative we will continue to develop extensions and applications of the QCM. We propose to continue predicting phenomena to be observed in high energy particle-nucleus collisions that reflect the rearrangement of quarks and gluons in nuclei. We will analyze the data from the SLAC NE3 experiment to discover whether they confirm the QCM prediction of "steps" in the ratio of nuclear structure functions when Bjorken x exceeds unity. In another effort, we will perform a search for narrow resonances in electron-positron interactions high in the continuum using the Bethe-Salpeter equation. These resonances are speculated to account for the positron peaks seen in the GSI heavy-ion experiments. We will also complete our development of microscopic effective Hamiltonians for nuclei structure which include the explicit treatment of delta resonances. These effective Hamiltonians will be used in constrained mean field calculations to evaluate conditions for nuclei to undergo a transition from nucleon matter to delta matter. 61 refs.

38271 **(DOE/ER/40150—22) 35 years of electron scattering.** Walecka, J.D. (Continuous Electron Beam Accelerator Facility, Newport News, VA (USA)). 1986. Contract AC05-84ER40150. 13p. (CEBAF-PR—87-002; CONF-8610239—2). NTIS MF A01; 2; GPO Dep. File Number DE87008491.

From Symposium celebrating 35 years of electron scattering in nuclear and particle science; Urbana, IL, USA (23 Oct 1986).

Historical aspects of electron reaction physics are presented. The presently understood picture of nuclear structure and the electron-nucleus interactions are discussed within the framework of the standard model.

38272 **(DOE/ER/40150—23) Parity violation workshop: CEBAF [Continuous Electron Beam Accelerator Facility].** Walecka, J.D. (Continuous Electron Beam Accelerator Facility, Newport News, VA (USA)). 11 Dec 1986. Contract AC05-84ER40150. 30p. (CEBAF-PR—87-003; CONF-861277—1). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87008675.

From Parity violation workshop - CEBAF; Newport News, VA, USA (11 Dec 1986).

This paper discusses the use of electron scattering experiments for exploring parity violation in the nuclear domain. It is shown how such experiments can test the structure of strong interactions, the local gauge theory quantum chromodynamics based on color, and the unified gauge theory of electroweak interactions. 14 refs., 13 figs., 1 tab. (DWL)

38273 **(N—87-20813) Statistical analysis of secondary particle distributions in relativistic nucleus-nucleus collisions.** Mcguire, S.C. (Alabama A and M Univ., Normal (USA)). Mar 1987. 44p. (NASA-CR—4054; NAS—1.26:4054). NTIS, PC A03/MF A01.

The use is described of several statistical techniques to characterize structure in the angular distributions of secondary particles from nucleus-nucleus collisions in the energy range 24 to 61 GeV/nucleon. The objective of this work was to determine whether there are correlations between emitted particle intensity and angle that may be used to support the existence of the quark gluon plasma. The techniques include chi-square null hypothesis tests, the method of discrete Fourier transform analysis, and fluctuation analysis. We have also used the method of composite unit vectors to test for azimuthal asymmetry in a data set of 63 JACEE-3 events. Each method is presented in a manner that provides the reader with some practical detail regarding its application. Of those events with relatively high statistics, Fe approaches 0 at 55 GeV/nucleon was found to possess an azimuthal distribution with a highly non-random structure. No evidence of non-statistical fluctuations was found in the pseudo-rapidity distributions of the events studied. It is seen that the most effective application of these methods relies upon the availability of many events or single events that possess very high multiplicities.

38274 **(ORNL/TM—10219) Calculated neutron-induced cross sections for /sup 58,60/Ni from 1 to 20 MeV and comparisons with experiments.** Hetrick, D.M.; Fu, C.Y.; Larson, D.C. (Oak Ridge National Lab., TN (USA)). Jun 1987. Contract AC05-84OR21400. 103p. (ENDF—344). NTIS, PC A06. File Number DE87011958.

Nuclear model codes were used to compute cross sections for neutron-induced reactions on both $^{58}$Ni and $^{60}$Ni for incident energies from 1 to 20 MeV. The input parameters for the model codes were determined through analysis of experimental data in this energy region. Discussion of the models used, the input data, the resulting calculations, extensive comparisons to measured data, and comparisons to the Evaluated Nuclear Data File (ENDF/B-V) for Ni (MAT 1328) are included in this report. 118 refs., 101 figs., 19 tabs.

38275 **Calculation of pair production by 10 and 20 MeV photons.** Wright, L.E.; Sud, K.K.; Kosik, D.W. (Department of Physics and Astronomy, Ohio University, Athens, Ohio 45701). *Physical Review [Section] C: Nuclear Physics;* **36**: No. 2, 562-572(Aug 1987).

We present new techniques for calculating electron-positron pair production in the field of a fixed point charge in distorted-wave Born approximation which permits the evaluation of the Dirac-Coulomb radial matrix elements for lepton energies much greater than the electron rest mass, and for large angular momenta. Using these techniques, the pair production cross sections for 10 and 20 MeV photons on uranium (Z = 92) are evaluated and compared to the so-called "bridging formulae" which connect the low

energy ($\omega<5$ MeV) distorted-wave Born approximation results to the approximate results for high energy ($\omega>50$ MeV) obtained with the Sommerfeld-Maue approximation and to the experimental results.

**38276 Microscopic analysis of projectile excitation for /sup 18/O+/sup 64/Ni.** Van Verst, S.P.; Kemper, K.W.; Carr, J.A. (Department of Physics, Florida State University, Tallahassee, Florida 32306). *Physical Review* [*Section*] *C: Nuclear Physics;* **36**: No. 2, 628-632(Aug 1987).

A microscopic analysis of the inelastic scattering of /sup 18/O from /sup 64/Ni is presented. The real transition potential for the excitation of the first $2^+$ state in /sup 18/O for /sup 18/O is calculated from the double folding model using proton and neutron transition densities determined from new medium energy electron and proton scattering data. The longer radial tail of the real transition potential obtained using this neutron transition density describes correctly the amplitude of oscillations in the Coulomb-nuclear interference region of the $2^+$ cross section. Unfortunately, coupled channels calculations, employing real double folded and imaginary Woods-Saxon interaction potentials and including reorientation of the /sup 18/O $2^+$ state, still fail to reproduce the phase of the Coulomb-nuclear interference pattern observed in the data. The imaginary part of the interaction potential, as the only phenomenological term remaining in the analysis, is suggested to be responsible for this defect.

**38277 Coriolis interaction and variable reflection asymmetry in fission vibrational resonances.** Lynn, J.E. (Los Alamos National Laboratory, Los Alamos, New Mexico 87544). *Physical Review* [*Section*] *C: Nuclear Physics;* **36**: No. 2, 671-680(Aug 1987).

A new analysis of the 720 keV gross resonance in the neutron-induced fission cross section of /sup 230/Th has been made. While confirming some of the main conclusions of earlier analyses (such as presence of a double-parity rotational band, suggesting an underlying vibrational mode in a tertiary well of the fission barrier), the new analysis explores additional features of the vibrational model, as well as employing new fission product angular distribution data and treating already available data in a different way. The new model and least squares analysis indicate strong evidence for Coriolis coupling of the K = 1/2 single-particle state and its coupled rotational motion with a K = (3/2 single-particle state and rotational band, probably lying at 930 keV neutron energy. There is also strong evidence that the opposite parity band in the 720 keV gross resonance, which is brought down by the reflection asymmetry in the tertiary potential energy well, is attenuated by a factor of about 3—5 by the fact that reflection asymmetry is not a property expected of the potential energy surface at the inner barrier containing the well.

**38278 Neutron capture resonances of /sup 152/Gd and /sup 154/Gd.** Macklin, R.L. (Oak Ridge National Lab., P.O. Box X, Building 6010, Oak Ridge, TN 37831-6354). *Nuclear Science and Engineering;* **95**: No. 4, 304-310(Apr 1987). Contract AC05-84OR21400.

Neutron resonance parameters were found for /sup 152/Gd up to 2700 eV. An average s-wave spacing D/sub o/ = (17.4 +- 1.0) eV and radiation width (58.6 +- 3.0) meV were found. The resonance contribution to the capture integral was found as (397 +- 32) n, exclusive of a 1/v term. Resonance parameters for /sup 154/Gd were extended from 490 to 2760 eV.

**38279 Global set of quadrupole deformation parameters for even-even nuclei.** Raman, S.; Nestor, C.W. Jr. (Oak Ridge National Lab., TN). pp 25-30 of Weak and electromagnetic interactions in nuclei. Proceedings. Klapdor, H.V. (ed.). Berlin, Germany, F.R.; Springer (1986). (CONF-860741—).

From International symposium on weak and electromagnetic interactions in nuclei; Heidelberg, F.R. Germany (1 Jul 1986).

We have completed a compilation of experimental results for the reduced electric quadrupole transition probability [B(E2)arrow up] between the $0^+$ ground state and the first $2^+$ state in even-even nuclei. This compilation together with certain simple relationships noted by other authors can be used to make reasonable predictions of unmeasured B(E2)arrow up values. The quadrupole deformation parameter $\beta_2$ immediately follows, because $\beta_2$ is proportional to [B(E2)arrow up]$^{1}$2/. 555 figures.

**38280 Electromagnetic properties of nuclei at high spins.** Leander, G.A. (UNISOR, Oak Ridge, TN; Oak Ridge Associated Universities, Inc., TN). pp 79-87 of Weak and electromagnetic interactions in nuclei. Proceedings. Klapdor, H.V. (ed.). Berlin, Germany, F.R.; Springer (1986). (CONF-860741—).

From International symposium on weak and electromagnetic interactions in nuclei; Heidelberg, F.R. Germany (1 Jul 1986).

The purpose of this paper is a review of the E1, M1, and E2 properties of such highly excited states, in order to set the stage with theoretical props for the section on this topic in the present volume. This review does not aspire to completeness or a fair distribution of credit for past achievements, but does attempt to highlight the major current research topics in the field. 555 figures.

**38281 Evolution of nuclear structure with spin and temperature.** Khoo, T.L. (Argonne National Lab., IL). pp 98-105 of Weak and electromagnetic interactions in nuclei. Proceedings. Klapdor, H.V. (ed.). Berlin, Germany, F.R.; Springer (1986). (CONF-860741—).

From International symposium on weak and electromagnetic interactions in nuclei; Heidelberg, F.R. Germany (1 Jul 1986).

In this talk the decay of the compound nucleus (CN) - from formation to ground state - will be described. The shape and nuclear structure evolution in this process will be traced, in which spin I and excitation energy E/sup */ decrease. Three topics will be discussed: (a) Shape relaxation following formation; (b) $\gamma$-decay towards the yrast line; and (c) $\gamma$-decay along the cold yrast line. 555 figures.

**38282 Massive lepton pair production - the Drell-Yan process - with nuclear targets.** Berger, E.L. (Argonne National Lab., IL). pp 374-381 of Weak and electromagnetic interactions in nuclei. Proceedings. Klapdor, H.V. (ed.). Berlin, Germany, F.R.; Springer (1986). (CONF-860741—).

From International symposium on weak and electromagnetic interactions in nuclei; Heidelberg, F.R. Germany (1 Jul 1986).

In this paper I show that inclusive hadronic production of massive lepton pairs from nuclei, hA->(lanti l)X, will provide unique information on the nuclear (A) dependence of the quark and antiquark density distributions in nuclei. In Sec. II, the Drell-Yan model is reviewed briefly, with particular emphasis on nuclear effects. Proton induced reactions, pA->$\gamma$/sup */X, are treated in Sec. III; both pion and antiproton reactions are examined in Sec. IV. Conclusions are summarized in Sec. V. 555 figures.

**38283 Nuclear probes of fundamental symmetries.** Adelberger, E.G. (Washington Univ., Seattle). pp 592-602 of Weak and electromagnetic interactions in nuclei. Proceedings. Klapdor, H.V. (ed.). Berlin, Germany, F.R.; Springer (1986). (CONF-860741—).

From International symposium on weak and electromagnetic interactions in nuclei; Heidelberg, F.R. Germany (1 Jul 1986).

Nuclei can be used in many ingenious studies of fundamental symmetries and my topic is so broad that it cannot be covered in a 30 minute talk. Hence I will restrict myself to giving an experimentalists quick overview of nuclear probes of three symmetries: isospin (I), parity (P) and time-reversal (T). I omit many currently active areas of research. Some of these (lepton nonconservation, neutrino masses and right-hand charged weak currents) are discussed elsewhere in this conference; others (such as axion searches) are not. 555 figures.

**38284 Proposal for a high sensitivity search for T-violation in slow neutron resonances.** Bowman, C.D.; Bowman, J.D.; Yuan, V.W. (Los Alamos National Lab., NM). pp 633-634 of Weak and electromagnetic interactions in nuclei. Proceedings. Klapdor, H.V. (ed.). Berlin, Germany, F.R.; Springer (1986). (CONF-860741—).

From International symposium on weak and electromagnetic interactions in nuclei; Heidelberg, F.R. Germany (1 Jul 1986).

**38285 Supernovae and high density nuclear matter.** Kahana, S. (Brookhaven National Lab., Upton, NY). pp 938-949 of Weak and electromagnetic interactions in nuclei. Proceedings. Klapdor, H.V. (ed.). Berlin, Germany, F.R.; Springer (1986). (CONF-860741—).

From International symposium on weak and electromagnetic interactions in nuclei; Heidelberg, F.R. Germany (1 Jul 1986).

The role of the nuclear equation of state (EOS) in producing prompt supernova explosions is examined. Results of calculations of Baron, Cooperstein, and Kahana incorporating general relativity and a new high density EOS are presented, and the relevance of these calculations to laboratory experiments with heavy ions considered. 555 figures.

**38286 Symmetries in heavy nuclei and the proton-neutron interaction.** Casten, R.F. (Brookhaven National Lab., Upton, NY). pp 87-105 of Symmetries in science II. Gruber, B.; Lenczewski, R. (eds.). New York, NY; Plenum Press (1986). Contract AC02-76CH00016.

The Interacting Boson Approximation (IBA) nuclear structure model can be expressed in terms of the U(6) group, and thereby leads to three dynamical symmetries (or group chains) corresponding to different nuclear coupling schemes and geometrical shapes. The status of the empirical evidence for these three symmetries is reviewed, along with brief comments on the possible existence of supersymmetries in nuclei. The relationships between these symmetries, the nuclear phase transitional regions linking them, and the residual proton-neutron interaction are discussed in terms of a particularly simple scheme for parameterizing the effects of that interaction. 34 references, 15 figures, 1 table.

**38287 Dynamical supersymmetric Diract Hamiltonians.** Ginocchio, J.N. (Los Alamos National Lab., NM). pp 175-183 of Symmetries in science II. Gruber, B.; Lenczewski, R. (eds.). New York, NY; Plenum Press (1986).

Most recently a relativistic quantum mechanical approach to nuclear physics has proven promising. It is known, however, from the interacting boson model and the fermion dynamical symmetry model of nuclei that nuclear spectra exhibit dynamical symmetries. The author postulates that these symmetries perhaps have their basis in a relativistic theory particularly since the spin-orbit potential is a relativistic effect. In this regard he explores the Dirac Hamiltonian of a neutral fermion interacting with a tensor field in the language of QED. He first discusses a supersymmetry found for a general Dirac Hamiltonian of this type and then goes on to the special case of the Dirac Hamiltonian of a neutral fermion interacting via an anomalous magnetic moment in an electric potential. He demonstrates the square of this Hamiltonian to be equivalent to a three-dimensional supersymmetric Schroedinger equation. 15 references.

**38288 Empirical evidences for fermion dynamical symmetries in nuclei.** Wu, C.L. (Drexel Univ., Philadelphia, PA). pp 567-583 of Symmetries in science II. Gruber, B.; Lenczewski, R. (eds.). New York, NY; Plenum Press (1986).

The similarities in symmetry between the fermion dynamical symmetries (FDS) model and the interacting boson model are evaluated. Empirical evidence which should allow the FDS model to stand on it own is then presented which shows that shell 7 and shell 8 possess SP(6) symmetry while shell 6 possesses SO(8) symmetry. For the nuclei with neutrons occupying shell 6 and protons occupying shell 5 the SO(8) symmetry is still preserved. Palladium isotopes 104-110 and ruthenium isotopes 98-104 are found to be good empirical realizations of the SO(7) subgroup chain in the SO(8) symmetry. This is the first example of a fermion dynamical symmetry in heavy nuclei that is not simply analogous to an established boson symmetry. Moreover, it is the first observed example of a symmetry that incorporates a variable structure applicable to nuclear transition regions. Its empirical verification is encouraging for the IBA and points toward a more fundamental origin for the observed symmetries of the latter. 16 references, 6 figures, 4 tables.

**38289 Space-time picture of relativistic propagation of medium energy hadrons through nuclei.** Bleszynski, M.; Jaroszewicz, T. (Physics Dept., UCLA, Los Angeles, CA 90024). pp 52-66 of Coherence, cooperation and fluctuations. Haake, F.; Narducci, L.M.; Walls, D.F. New York, NY; Cambridge University Press (1985). (CONF-8510395—).

From Symposium in honor of Roy J. Glauber, Harvard University: coherence, cooperation and fluctuations; Cambridge, MA, USA (19 Oct 1985).

Relativistic virtual pair creation effects in hadron-nucleus scattering at medium energies are discussed. A close analogy is found between these effects (particle propagation backwards in time) and some of noneikonal correlations to the Glauber theory, arising from particle propagation backwards in space. In multiple scattering both effects appear only for configurations involving overlapping scatterers and lead to the non-additivity of phase shifts. The proper-time path-integral formalism is found to provide an intuitive geometrical picture of these phenomena. The relativistic corrections are estimated to be of the order k/(aE/sup 2/), k being the particle momentum, E its energy, and a the target size. At medium energies they are comparable to noneikonal corrections, of order 1/(ak). Both effects vanish at high energy, when particle propagation in space-time can be described by means of geometrical optics.

**38290 Nuclear structure problems in double beta decay.** Haxton, W.C.; Stephenson, G.J. (Institute for Nuclear Theory, Univ. of Washington, Seattle, WA 98195). pp 148-155 of Neutrino mass and low energy weak interactions. Barger, V.; Cline, D. Teaneck, NJ; World Scientific Pub. Co. (1985).

The authors summarize some of the nuclear structure issues in theoretical treatments of $\beta\beta$ decay, emphasizing several of the less well-tested approximations commonly made.

**38291 (CONF-870405—10) New buildup factor data for point kernel calculations.** Trubey, D.K.; Harima, Y. (Oak Ridge National Lab., TN (USA); Tokyo Inst. of Tech. (Japan). Research Lab. of Nuclear Reactor). 1986. Contract AC05-84OR21400. 9p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87000233.

From Radiation protection and shielding conference; Knoxville, TN, USA (22 Apr 1987).

An American Nuclear Society Standards Committee Working Group, identified as ANS-6.4.3, is developing a set of evaluated gamma-ray isotropic point-source buildup factors and attenuation coefficients for a standard reference data base. As a first step, a largely unpublished set of buildup factors calculated with the moments method has been evaluated by recalculating key values with Monte Carlo, integral transport, and discrete ordinates methods. Attention is being given to frequently-neglected processes such as bremsstrahlung and the effect of introducing a tissue phantom behind the shield. The proposed standard contains data for a source energy range from 15 keV to 15 MeV and for approximately 19 elements and 3 mixtures (water, air, and concrete). The data will also be represented as coefficients for the G-P fitting function. The 1985 data base was released as part of the CCC-493B/QAD-CGGP code package available from the Radiation Shielding Information Center (RSIC).

**38292 (DOE/ER/45160—1) Mirror and Bragg reflections of neutrons at a nuclear resonance: [Final technical report].** Batigun, C.M.; Brugger, R.M. (Missouri Univ., Columbia (USA). Research Reactor Facility). [1987]. Contract FG02-84ER45160. 21p. NTIS, PC A02. File Number DE87012077.

These experiments have observed the mirror reflection and Bragg diffraction of neutrons at the energy of a low lying nuclear resonance of $^{115}$In. The reflector was a mirror of In metal with the resonance at 1.457 eV. The mirror reflection for different angles of incidence has been measured and sets of data showing the relative

reflectivities have been obtained. For the Bragg diffraction, the crystal was a wafer of InP and several examples of Bragg reflections near 1.455 eV were measured. 4 refs., 12 figs.

**38293 (AD-A—179366/0/XAB) Angular-momentum theory applied to interactions in solids. Summary progress report.** Morrison, C.A. (Harry Diamond Labs., Adelphi, MD (USA)). Feb 1987. 164p. (HDL-SR—87-1). NTIS, PC A08/MF A01.

This report discusses those concepts of group theory that are applied to the spectra of impurity ions in crystals. Beginning with the simple hydrogen atom, spectroscopic notation and angular-momentum operators are discussed. This is followed by a general discussion of angular-momentum theory including Clebsch-Gordon coefficients, the Wigner-Eckart theorem, unit spherical tensors, and Racah coefficients. The extension of these techniques to the electronic configuration, (l to the Nth power), for N equivalent electrons is discussed. The theory of point groups as applied to ions in solids is introduced, along with the use of the International Tables of Crystallography and character tables. The phenomenological theory of crystal fields is discussed in some detail along with the so-called free-ion parameters characterizing the Coulomb interaction, the spin-orbit interaction, and the interconfiguration interaction. The use of tables of 3-j and 6-j symbols used in the calculation of the matrix elements of the various interactions is presented, along with other tables and aids in the computation of the energy levels. The point ion model of crystal-field interaction is discussed with particular emphasis on the work done at the Harry Diamond Laboratories (HDL) on its development. The earlier work at HDL was applied to triply ionized rare earth ions (l to the Nth power) electronic configuration), and the preliminary extensions presently being undertaken at HDL are applied to the transition-metal ions with the electronic configurations d to the Nth power (n=3,4, and 5).

**38294 (AD-A—179573/1/XAB) Coherence and many-body phenomena. Technical report (Final), 15 August 1984-14 August 1986.** Scully, M.O. (New Mexico Univ., Albuquerque (USA). Center for Advanced Studies). 1 Dec 1986. 119p. NTIS, PC A06/MF A01.

For a gas of simple atoms, it was found that a weak pulsed arbitrary transverse spatial dependence was prone to longitudinal propagation which was not affected by diffractive spreading. Progress was also made on the possibility of exchanging forbidden nuclear beta decay by exposure to radiofrequency fields. The interactions of charged particles in a laser field was also studied. Other areas of investigation included: 1) Internal conversion in an intense radiation field, 2) many-body and solid-state physics, 3) the role of laser amplitude fluctuations in nonlinear optical processes, and 4) atomic theory.

**38295 (BNL—39805) Artificial magnetic superlattices.** Majkrzak, C.F. (Brookhaven National Lab., Upton, NY (USA)). 1987. Contract AC02-76CH00016. 22p. (CONF-870272—4). NTIS, PC A02. File Number DE87010753.

From American Institute of Metallurgical Engineers annual meeting: light metals session; Denver, CO, USA (22 Feb 1987).

Neutron diffraction is an established method for studying long-range magnetic order in bulk condensed matter systems. Despite the comparatively small volumes of typical synthetic superlattice samples, neutrons can in fact be used to determine their microscopic magnetic structures as well. In particular, the magnetization profile along the modulation direction of a ferromagnetic thin film multilayer can be obtained from polarized neutron scattering measurements whether the films be amorphous or crystalline, provided that the superlattice periodicity is sufficiently well-defined. In addition to determining interfacial magnetic states and the effects of reduced dimensionality, inter-layer magnetic coupling can also be investigated. Actual neutron diffraction studies of magnetic superlattices are described as illustrative examples.

**38296 (CONF-870588—2) Multiphoton ionization followed by time-of-flight mass spectroscopy of sputtered neutrals.** Pellin, M.J.; Young, C.E.; Gruen, D.M. (Argonne National Lab., IL (USA)). 1987. Contract W-31109-ENG-38. 37p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87011455.

From 20. annual scanning electron microscopy conference; Hamilton, Canada (3 May 1987).

Multiphoton ionization (MPI) by pulsed, tunable lasers provides a sensitive means for detection of neutral atoms. This resonant MPI technique can access all atomic states including ground and metastable levels. The MPI technique permits detailed sputtering data to be obtained with minimal target damage. Velocity and angular distributions can be obtained for each energy level of every sputtered species. Two types of experimental configuration have been employed. In one method, the photoionized atoms are allowed to strike a spatially resolved detector near the target, with extraction fields that preserve the angular distribution information. Velocity information is obtained by time-of-flight (TOF). This method is most suitable for majority species in the sputtered flux. In the case of minority species (either very dilute surface constituents or highly excited states produced), additional noise reduction is necessary. A suitable configuration involves extraction of the photoions into a sector-field TOF mass spectrometer. In standard, isochronous operation, energy and angular spreads at the point of ionization are compensated in flight to produce sharp TOF mass spectra. Noise sources (photons, metastable and scattered atoms) escaping through transparent grids are strongly suppressed. Angular distributions can be mapped. Velocity data can be obtained.

**38297 (DOE/ER/45135—17) Electronic properties of two-dimensional systems in sub-micron devices: Final report, September 1, 1985-November 30, 1986.** O'Connell, R.F. (Louisiana State Univ., Baton Rouge (USA). Dept. of Physics and Astronomy). 1986. Contract FG05-84ER45135. 11p. NTIS, PC A02/MF A01. File Number DE87009448.

This final report gives brief descriptions of research in magneto-optical studies (with emphasis on Faraday rotation) of two-dimensional systems; the Wigner distribution function, which in general has been concerned both with the fundamentals and with applications to specific problems in two-dimensional systems; and a generalized quantum Langevin approach to heat-bath problems in condensed-matter physics (as well as to a variety of problems in other areas).

**38298 (LA—10989-T) An experimental measurement of metal multilayer x-ray reflectivity degradation due to intense x-ray flux.** Hockaday, M.Y.P. (Los Alamos National Lab., NM (USA)). Jun 1987. Contract W-7405-ENG-36. 252p. NTIS, PC A12/MF A01; 1; GPO Dep. File Number DE87010835.

The degradation of the x-ray reflection characteristics of metal multilayer Bragg diffractors due to intense x-ray flux was investigated. The Z-pinch plasma produced by PROTO II of Sandia National Laboratories, Albuquerque, New Mexico, was used as the source. The plasma generated total x-ray yields of as much as 40 kJ with up to 15 kJ in the neon hydrogen- and helium-like resonance lines in nominal 20-ns pulses. Molybdenum-carbon, palladium-carbon, and tungsten-carbon metal multilayers were placed at 15 and 150 cm from the plasma center. The multilayers were at nominal angles of 5° and 10° to diffract the neon resonance lines. The time-integrated x-ray reflection of the metal multilayers was monitored by x-ray film. A fluorescer-fiber optic-visible streak camera detector system was then used to monitor the time-resolved x-ray reflection characteristics of 135 A- 2d tungsten-carbon multilayers. A large specular component in the reflectivity prevented determination of the rocking curve of the multilayer. For a neon implosion onto a vanadium-doped polyacrylic acid foam target shot, detailed modeling was attempted. The spectral flux was determined with data from 5 XRD channels and deconvolved using the code SHAZAM. The observed decay in reflectivity was assumed to correspond to the melting of the first tungsten layer. A "conduction

factor" of 82 was required to manipulate the heat loading of the first tungsten layer such that the time of melting corresponded to the observed decay. The power at destruction was 141 MW/cm$^2$ and the integrated energy at destruction was 2.0 J/cm$^2$. 82 refs., 66 figs., 10 tabs.

38299 **(LBL—22991) Pulsed zero field NMR of solids and liquid crystals.** Thayer, A.M. (Lawrence Berkeley Lab., CA (USA)). Feb 1987. Contract AC03-76SF00098. 347p. NTIS, PC A15/MF A01; 1; GPO Dep. File Number DE87011216.

This work describes the development and applications to solids and liquid crystals of zero field nuclear magnetic resonance (NMR) experiments with pulsed dc magnetic fields. Zero field NMR experiments are one approach for obtaining high resolution spectra of amorphous and polycrystalline materials which normally (in high field) display broad featureless spectra. The behavior of the spin system can be coherently manipulated and probed in zero field with dc magnetic field pulses which are employed in a similar manner to radiofrequency pulses in high field NMR experiments. Nematic phases of liquid crystalline systems are studied in order to observe the effects of the removal of an applied magnetic field on sample alignment and molecular order parameters. In nematic phases with positive and negative magnetic susceptibility anisotropies, a comparison between the forms of the spin interactions in high and low fields is made. High resolution zero field NMR spectra of unaligned smectic samples are also obtained and reflect the symmetry of the liquid crystalline environment. These experiments are a sensitive measure of the motionally induced asymmetry in biaxial phases. Homonuclear and heteronuclear solute spin systems are compared in the nematic and smectic phases. Nonaxially symmetric dipolar couplings are reported for several systems. The effects of residual fields in the presence of a non-zero asymmetry parameter are discussed theoretically and presented experimentally. Computer programs for simulations of these and other experimental results are also reported. 179 refs., 75 figs.

38300 **(SAND—86-2874) Modeling of shock-induced solid state chemistry.** Horie, Y.; Kipp, M.E. (Sandia National Labs., Albuquerque, NM (USA)). Jun 1987. Contract AC04-76DP00789. 40p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87011578.

This report, a sequel to Sandia Report 86-0922 entitled "Shock-Induced Solid State Chemistry: Theoretical Background" by Y. Horie, describes models of chemical reactions in inorganic powder mixtures under high pressure shock wave loading. In the present work, two mathematical models, one homogeneous and the other heterogeneous, were formulated based mostly upon existing results of observations on post-shock samples of Al-Ni, Al-Ti, and ZnO-$Fe_2O_3$ mixtures. Two basic mechanisms were isolated for the development of the initial models: (1) the creation of a nonequilibrium mixture by dynamic mass mixing, and (2) ensuing chemical reactions. The homogeneous model was evaluated under shock conditions using the one dimensional wave propagation code WONDY-V. We found that results of recent measurements can be rationalized by the model. The model also suggested requisite conditions for the thermal excursion of localized reactions: a localized initial peak temperature of 1000K to 2000K and reaction time constants of 1 μsec or less. Evidence that reactions occurred while the sample was under shock loading may also be rationalized by observations of post-shock samples.

38301 **(SAND—87-0765C) An analytical model for Rayleigh-Taylor instability in solids.** Robinson, A.C. (Sandia National Labs., Albuquerque, NM (USA)). 1987. Contract AC04-76DP00789. 4p. (CONF-870753—2). NTIS, PC A02/MF A01; GPO Dep. File Number DE87011064.

From 5. topical conference of the American Physical Society on shockwaves in condensed matter; Monterey, CA, USA (20 Jul 1987).

The model equations described in this paper are able to reproduce the qualitative behavior of the elastic-plastic Rayleigh-Taylor instability response seen in numerical experiments. Both elastic shear modulus and yield strength play important roles in the response characteristics. For low driving pressures a critical amplitude stability criterion may be appropriate. For sustained high pressure this rule will not be sufficient as there will exist wavelengths on the order of the plate thickness.

38302 **(UCID—21101) Molecular dynamics studies of energy transfer processes in crystal systems: Annual summary report.** Karo, A.M. (Lawrence Livermore National Lab., CA (USA)). Dec 1986. Contract W-7405-ENG-48. 17p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011899.

A two-dimensional model is presented for a nitromethyl radical which has been placed in a matrix of weakly-bound atoms three to four times heavier than the heaviest of the molecular atoms. The energy content of the molecule as a whole has been monitored as a function of time, as well as the energy flux into and out of specific bonds. This has been done for two cases, one in which the radical is embedded well within the lattice and a second where the radical is ejected from the lattice along with a sizeable amount of material. In addition, the energy flux was monitored for each molecular bond.

38303 **Density-of-states calculations within the recursion method.** Woodruff, D.M.; Anlage, S.M.; Smith, D.L. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physical Review [Section] B: Condensed Matter;* **36**: No. 3, 1725-1734(15 Jul 1987).

We investigate methods to calculate projected density of states from a finite set of recursion coefficients. We consider tight-binding Hamiltonians describing the diamond-structure semiconductors α-Sn, Ge, Si, and C. Coefficients for about 110 levels of recursion are available for these Hamiltonians. Thus, we have coefficients for a sufficient number of recursion levels so that their asymptotic behavior is apparent. We first extrapolate the calculated coefficients using a linear predictive analysis suggested by Allan. This extrapolation is based on a perturbation theory that assumes that band gaps are small compared to the bandwidth. For α-Sn, Ge, and Si, which have band gap to bandwidth ratios (for the model Hamiltonians) of less than 0.05, the extrapolation procedure is found to be very successful. For C, however, with a band gap to bandwidth ratio of 0.106, large spurious features, which can be clearly associated with second-order perturbation terms, appear in the calculated density of states. We modify the extrapolation procedure using nonperturbative results for the asymptotic behavior of the recursion coefficients. The new extrapolation procedure gives good densities of states for C. Also, the calculated Green's function has the correct analytic structure.

38304 **Dielectric susceptibility of classical Coulomb systems. II.** Choquard, Ph.; Piller, B.; Rentsch, R. (Ecole Polytechnique Federale de Lausanne, Switzerland). *Journal of Statistical Physics;* **46**: No. 3/4, 599-633(Feb 1987).

This paper deals with the shape dependence of the dielectric susceptibility (equivalently defined, in a canonical ensemble, by the mean square fluctuation of the electric polarization or by the second moment of the charge-charge correlation function) of classical Coulomb systems. The concept of partial second moment is introduced with the aim of analyzing the contributions to the total susceptibility of pairs of particles of increasing separation. For a disk-shaped one-component plasma with coupling parameter $\gamma=2$ it is shown, numerically and algebraically for small and large systems, that (1) the correlation function of two particles close to the edge of the disk decays as the inverse of the square of their distance, and (2) the susceptibility is made up of a bulk contribution, which saturates rapidly toward the Stillinger-Lovett value, and of surface contribution, which varies on the scale of the disk diameter and is described by a new law called the arc sine law. It is also shown that electrostatics and statistical mechanics with shape-dependent thermodynamic limits are consistent for the same model in a strip geometry, whereas the Stillinger-Lovett sum rule is verified for a boundary-free geometry such as the surface of a sphere. Some results of extensive computer simulations of one- and two-component plasmas in circular and elliptic geometries are shown. Anisotropy effects on the susceptibilities are clearly demonstrated and the arc sine law for a circular plasma is well confirmed.

38305 **Quantum-resolved gas-surface scattering: NH/sub 3/ from Au (111).** Kay, B.D.; Raymond, T.D.; Coltrin, M.E. (Sandia National Labs., Albuquerque, NM 87185). pp 56-61 of Topical meetings on lasers in materials diagnostics (Summaries). Washington, DC; Optical Society of America (1987). (CONF-870220—). Contract AC04-76DP00789.

From Southwest optics conference; Albuquerque, NM, USA (9 Feb 1987).

WE2.

The authors measured angular, velocity, and quantum-state distributions for ammonia molecules scattered from a gold (111) single crystal for a number of surface temperatures and incident beam energies. A molecular beam source produces a well-collimated, rotationally cold (—15 K) beam of NH/sub 3/ molecules with a narrow dispersion of translational energy (—10%). The molecular beam impinges on an atomically clean, single crystal of gold (111) and the scattered NH/sub 3/ is detected in a quantum-resolved manner using two-photon resonant, three-photon ionization. The scattered angular distributions are sharply peaked about the specular angle, in contrast to the broad distributions observed in our earlier studies of NH/sub 3/ scattering from NH/sub 3/-saturated W (100). The final velocity distributions indicate a non-equilibrated mean translational energy, which is highly dependent on the incident beam kinetic energy. The mean scattered energy is up to five times that expected if this degree of freedom were fully accommodated with the surface.

Dept. of Physics; Nordisk Inst. for Teoretisk Atomfysik, Copenhagen (Denmark); Los Alamos National Lab., NM (USA)). 1987. Contract W-7405-ENG-36. 13p. (CONF-870682—2). NTIS, PC A02/MF A01; GPO Dep. File Number DE87011749.

From Workshop on novel mechanisms for superconductivity; Berkeley, CA, USA (22 Jun 1987).

This paper reviews the experimental results and physical arguments which led us to conclude that in heavy electron systems the physical mechanism responsible for superconductivity is an attractive interaction between the heavy electrons which results from the virtual exchange of antiferromagnetic f-electron moment fluctuations. In these systems, then, the superconductivity is of purely electronic origin; the phonon-induced interaction between electrons which leads to superconductivity in ordinary metals plays little or no role.

38307 **(AD-A—179510/3/XAB) Architectural implications of a parallel-computational approach to the vector-wave equation. Master's thesis.** Strauss, J.L. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). Mar 1987. 111p. (AFIT/GE/ENG—87M-5). NTIS, PC A06/MF A01.

An algorithm was specified for the hardware implementation of the numerical solution of the electromagnetic fields of an arbitrary current source. The algorithm, defined as the Vector Wave Equation (VWE), solves for the magnetic and electric fields, as well as the vector potential of a finite-length arbitrary current source. The specified algorithm was verified through FORTRAN simulation to produce results accurate to within 2 decimal places for a 500-subelement dipole. The VWE forms a model that is algorithmically symmetric with respect to the cartesian-coordinate system. As such, the VWE lends itself to highly parallel and concurrent computational techniques. This property of the algorithm makes it an excellent candidate for implementation by a Very High Speed Integrated Circuit (VHSIC) class processor. Investigation of a parallel, highly concurrent architectural implementation yielded preliminary results that computational savings of a factor of 3 and a throughput-rate increase of 5 orders of magnitude is attainable. This research has shown that an application-specific VHSIC-class processor array has sufficient computing power to support interactive calculation of a set of equations which solve for the magnetic and electric fields, as well as the vector potential of an arbitrarily current source.

38308 **(LBL—23578) Quantum chemical methods for massively parallel computers.** Colvin, M.E. (Lawrence Berkeley Lab., CA (USA)). Nov 1986. Contract AC03-76SF00098. 119p. NTIS, PC A06/MF A01; 1; GPO Dep. File Number DE87012058.

For many years it has been recognized that fundamental physical constraints such as the speed of light will limit the ultimate speed of single processor computers to less than about three billion floating point operations per second. A way to avoid this limit is to harness together many processors to work on a single computation problem. The work described in this thesis represents a first step toward the development of a general system of parallel quantum chemistry programs. Parallel algorithms have been developed for several important quantum chemical techniques: integral evaluation, self consistent field calculation, integral transformation and second order Moller Plesset energy calculation. These algorithms have been implemented and tested on a 32 processor Intel Hypercube. The benchmark calculations indicate very good parallel performance for all of these algorithms. The most computationally complex step, the two electron integral transformation, exhibits nearly perfect parallel speedup. That is, when utilizing n processors, the execution speed is increased by a factor of n over the single processor implementation.

38309 **(SLAC-PUB—4257) Measurement by phase severance.** Noyes, H.P. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Mar 1987. Contract AC03-76SF00515. 3p. (CONF-870892—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010463.

From Symposium on the foundations of modern physics; Joensuu, Finland (6 Aug 1987).

It is claimed that the measurement process is more accurately described by "quasi-local phase severance" than by "wave function collapse". The approach starts from the observation that the usual route to quantum mechanics starting from the Hamilton-Jacobi equations throws away half the degrees of freedom, namely, the classical initial state parameters. To overcome this difficulty, the full set of Hamilton-Jacobi equations is interpreted as operator equations acting on a state vector. The measurement theory presented is based on the conventional S-matrix boundary condition of N/sub A/ free particles in the distant past and N/sub B/ free particles in the distant future and taking the usual free particle wave functions, multiplied by phase factors.

38310 **(SLAC-PUB—4259) On the discrete reconciliation of relativity and quantum mechanics.** Noyes, H.P. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Mar 1987. Contract AC03-76SF00515. 3p. (CONF-870293—1). NTIS, PC A02. File Number DE87010543.

From 26. Schladming winter school in particle physics; Schladming, Austria (17 Feb 1987).

A way is sketched to replace physics based on arbitrary units of mass, length, and time by counting in terms of these quantized values and to replace continuum mathematical physics by computer science. The consequences of such a discrete physics are summarized. These are obtained by postulating finiteness, discreteness, finite computability, absolute non-uniqueness, and additivity. (LEW)

38311 **On the role of density fluctuations in the entropy of a fluid.** Wallace, D.C. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Chemical Physics;* **87**: No. 4, 2282-2284(15 Aug 1987).

The phase-space region occupied by a dense fluid is characterized by significant multiparticle correlations, and by small density fluctuations. On the basis of this characterization, a statistical-mechanical formula is constructed, to represent the entropy of an

equilibrium dense fluid. For the example of fluid sodium, the statistical entropy agrees well with the measured thermodynamic entropy.

38312 **Isynchronous motion in classical mechanics.** Osypowski, E.; Olsson, M.G. (Physics Department, University of Wisconsin-Marathon, Wausau, Wisconsin 54401). *American Journal of Physics;* **55**: No. 8, 720-725(Aug 1987).

Those oscillatory motions for which the period is independent of the total energy are investigated. There is only one corresponding symmetric potential, the quadratic potential of the simple harmonic motion but infinite classes of asymmetric potentials must be considered. Geometric and analytic requirements of isochronism are discussed and several specific examples are given.

38313 **Synthesis of digital holograms by direct binary search.** Seldowitz, M.A.; Allebach, J.P.; Sweeney, D.W. (Purdue University, School of Electrical Engineering, West Lafayette, Indiana 47907). *Applied Optics;* **26**: No. 14, 2788-2798(15 Jul 1987).

A new approach to the design of computer-generated holograms makes optimal use of the available device resolution. An iterative search algorithm minimizes an error criterion by directly manipulating the binary hologram and observing the effect on the desired reconstruction. Several measures of error and efficiency useful in assessing the optimality of digital holograms are defined. Methods for designing digital holograms that are based on projections and error diffusion are presented as established techniques for comparison to direct binary search.

38314 **Conformal invariance and torsion in general relativity.** Maluf, J.W. (Univ. of Rochester, NY). *General Relativity and Gravitation;* **19**: No. 1, 57-71(Jan 1987). Contract AC02-76ER13065.

The authors study a theory for gravity in which the linear connections are assumed to be arbitrary, except that they are restricted to satisfy the metric condition $\Delta/\text{sub}\ \mu/\ g/\text{sup}\ \lambda\ \nu/ = 0$. A scalar field is added to the theory, and a conformally invariant action integral, linear in the curvature tensor, is defined. The linear connections emerging from the variational principle contain torsion that is related to a propagating spin-1 vector field, identified as the electromagnetic gauge potential. They obtain a set of conformally invariant equations for the metric field, and conclude that Einstein's equations arise from a particular choice of gauge. Finally, spin-1/2 fields are introduced by means of the vierbein formalism, and the qualitative features of the theory are maintained.

38315 **Mysterious world of symmetry in physics.** Iachello, F. (Yale Univ., New Haven, CT). pp 1-17 of Symmetries in science II. Gruber, B.; Lenczewski, R. (eds.). New York, NY; Plenum Press (1986). Contract AC02-76ER03074.

The author describes the various ways in which the concept of symmetry is used in physics today. Starting from the notion of symmetry in art, he discusses briefly its applications to physics.

38316 **Dynamic symmetries in scattering.** Iachello, F. (Yale Univ., New Haven, CT). pp 247-254 of Symmetries in science II. Gruber, B.; Lenczewski, R. (eds.). New York, NY; Plenum Press (1986). Contract AC02-76ER03074.

The author discusses a recent suggestion that dynamic symmetries and spectrum generating algebras can be used to describe scattering problems. 12 references, 1 figure.

38317 **Are the Dirac strings harmless?.** Lipkin, H.J.; Peshkin, M. (Argonne National Lab., IL). pp 323-328 of Symmetries in science II. Gruber, B.; Lenczewski, R. (eds.). New York, NY; Plenum Press (1986). Contract W-31-109-ENG-38.

The authors explore the physics involved in the interaction of a magnetic charge with an external magnetic field due to electric currents by means of a simple soluble model which includes the variables of the source of the magnetic field. They find that when those variables are included in the dynamical theory, there is no difficulty. The Hamiltonian exists, the energy is conserved, and the equations of motion are correct. However, in the limit where the current is externally fixed, paradoxes arise which appear to have serious implications for local theories based on the Maxwell fields or the vector potentials. Those paradoxes can be avoided by introducing Dirac strings, but then the strings appear not to be physically harmless. They imply the existence of a topological winding number variable which would not be present for amonopole without a Diract string. 5 references.

38318 **The group velocity of short optical pulses.** Ackerhalt, J.R.; Drummond, P.D.; Eberly, J.H. (Group T-12, Los Alamos National Lab., Los Alamos, NM 87545). pp 104-114 of Coherence, cooperation and fluctuations. Haake, F.; Narducci, L.M.; Walls, D.F. New York, NY; Cambridge University Press (1985). (CONF-8510395—).

From Symposium in honor of Roy J. Glauber, Harvard University: coherence, cooperation and fluctuations; Cambridge, MA, USA (19 Oct 1985).

Slow-varying-envelope techniques, analogous to those pioneered by Glauber in early studies of high energy particle scattering, are also widely used in quantum optics. The authors review the application of these techniques to short optical pulse propagation. They point out that the usual phase and group velocities may be ill-defined if the medium of propagation contains atoms or molecules with far off-resonant and near-resonant dipole transitions that share a common level.

# 70 FUSION ENERGY

## 7001 Plasma Research

*REFER ALSO TO CITATION(S) 38298, 38371, 38373*

38319 **(AD-A—179527/7/XAB) Plasma theory and simulation. Quarterly progress report Nos. 3 and 4, 1 July-31 December 1985.** Birdsall, C.K. (California Univ., Berkeley (USA). Electronics Research Lab.). 31 Dec 1985. 58p. NTIS, PC A04/MF A01.

Contents include: linear magnetized plasma response to an oblique electrostatic wave; limits of linear response of a Vlasov distribution; saturation and post-saturation behavior of the Alfven ion-cyclotron instability: a simulation study; stabilizing effects of finite-amplitude r-f waves on the interchange instability; effect of large amplitude perpendicularly-propagating rf waves on the interchange instability; numerical simulations of turbulent trapping in the weak beam plasma instability: study of the growth rates; planar magnetron discharge simulations; planar magnetron discharges: mechanisms for instability, and numerical study of equilibrium; ES2: an electrostatic 2-D bounded simulation code with injection and external circuit; and energy conserving reflection algorithm.

38320 **(BNL—39605) Some thoughts on the muon catalyzed fusion reactor.** Takahashi, H. (Brookhaven National Lab., Upton, NY (USA)). 1986. Contract AC02-76CH00016. 25p. (CONF-8609135—8). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010056.

From International symposium on muon-catalyzed fusion; Tokyo, Japan (1 Sep 1986).

The design of the muon catalyzed fusion reactor is discussed. Some of the engineering challenges and critical research areas such as $\pi^-$ meson transport, beam entry single crystal window and coherent x-ray for stripping the muon from $\alpha$ particle, are considered. In order to reduce the tritium inventory and neutron wall loading, use of the laser technique for manipulating the d-t mixture is considered. The heterogeneous d-t mixture using the droplet or jet is discussed. 39 refs., 6 figs.

38321 **(CONF-870570—9) Ion cyclotron emission calculations using a 2D full wave numerical code.** Batchelor, D.B.; Jaeger, E.F.; Colestock, P.L. (Oak Ridge National Lab., TN (USA); Princeton Univ., NJ (USA). Plasma Physics Lab.). 1987. Contract AC05-84OR21400. 4p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87009119.

From 7. topical conference on applications of radio-frequency power to plasmas; Kissimmee, FL, USA (4 May 1987).

Measurement of radiation in the HF band due to cyclotron emission by energetic ions produced by fusion reactions or neutral beam injection promises to be a useful diagnostic on the large devices which are entering the reactor regime of operation. A number of complications make the modelling and interpretation of such measurements difficult using conventional geometrical optics methods. In particular, the long wavelength and lack of high directivity of antennas in this frequency regime make observation of a single path across the plasma into a viewing dump impractical. Pickup antennas effectively see the whole plasma and wall reflection effects are important. The 2D full wave ICHR code has been modified to calculate wave fields due to a distribution of energetic ions in tokamak geometry. The radiation is modeled as due to an ensemble of localized source currents distributed in space. The spatial structure of the coherent wave field is then calculated including cyclotron harmonic damping as compared to the usual procedure of incoherently summing powers of individual radiators. This method has the advantage that phase information from localized radiating currents is globally retained so the directivity of the pickup antennas is correctly represented. Also, standing waves and wall reflections are automatically included.

**38322 (CONF-8610280—1) Solution to workshop problem 6 (hollow sphere) in the shell approximation with EDDYNET-2D.** Turner, L.R. (Argonne National Lab., IL (USA)). Nov 1986. Contract W-31109-ENG-38. 12p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87004838.

From International workshop for eddy current code comparison; Tokyo, Japan (20 Oct 1986).

The problem of the hollow sphere in a sinusoidal field has been solved in the single shell approximation with the code EDDYNET. Solutions with three different meshes are compared among themselves and with axisymmetric solutions obtained by 2-D codes. Agreement is good for total current and for field at points outside the sphere. Agreement is fair for field at interior points, where the field results from near cancellation of applied and induced fields. Agreement is poor for power dissipation and for the field at points in or near the conducting shell. The limited agreement is to be expected in using a single shell to model a hollow sphere with thickness greater than one skin depth.

**38323 (CONF-8706119—1) Modification of tokamak ballooning stability boundaries by alpha populations.** Spong, D.A.; Sigmar, D.J.; Ramos, J.J. (Oak Ridge National Lab., TN (USA); Massachusetts Inst. of Tech., Cambridge (USA). Plasma Fusion Center). Jun 1987. Contract AC05-84OR21400. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010605.

From Workshop on alpha particle effects in ETR; Washington, DC, USA (15 Jun 1987).

For T/sub $\alpha$//T/sub i/ < 150 (where T/sub $\alpha$/ is the $\alpha$-mean energy and T/sub i/ the ion temperature) the trapped $\alpha$-precession resonance destabilizes the kinetic ballooning mode of the bulk plasma. Using a slowing down distribution and both circular and noncircular equilibrium models, the eigenfrequencies of the resonant ballooning integral equation are computed. One finds lower critical betas and a widening of the unstable region, particularly at higher electron temperature and for flat q, steep pressure profiles typical of ignited sawtoothing plasmas.

**38324 (DOE/ER/13449—T8) Enhancing the muon-catalyzed fusion yield.** Jones, S.E. (Brigham Young Univ., Provo, UT (USA). Dept. of Physics and Astronomy). 1986. Contract FG02-85ER13449. 6p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87010969.

This paper discusses the process of muon-catalyzed fusion and the reactions involved in this process. The muon catalysis cycle has been described including the muon-catalysis cycling rate. The alpha sticking behavior has been investigated as a means of increasing fusion yields. The effects of density and temperature have also been studied as to fusion yield increase. (FI)

**38325 (DOE/ER/52127—12) An alpha loss-cone instability in the central cell of a tandem mirror reactor.** Ho, Shu Kay. (Illinois Univ., Urbana (USA). Fusion Studies Lab.). 1987. Contract FG02-86ER52127. 221p. NTIS, PC A10/MF A01; 1; GPO Dep. File Number DE87011044.

D-T fusion-born alpha particles are mirror-confined in the central cell of a tandem mirror reactor. The resulting anisotropic loss-cone distribution of the alpha particles in velocity space is capable of destabilizing low frequency plasma waves, thus affecting the energy balance in a tandem mirror plasma. The low frequency waves of a cold, cylindrical, sharp-boundary, D-T plasma are studied. Techniques have been developed to trace the wave propagation regions and search the wave eigenfrequencies. Three branches of waves are found, namely the Alfven, hybrid, and fast waves; but only the Alfven wave is destabilized by the alpha loss-cone instability. The modeling of the alpha distribution function for the linear and quasi-linear instability calculations is done by a diffusion-front method and a numerical finite difference method, respectively. Their validity is established by comparing them with a converged 80-term Legendre function expansion model of the alpha distribution. The growth rate of the instability is basically determined by the alpha number density, the loss-cone angle, and the polarization of the wave. These quantities are in turn mainly affected by the density and temperature of the plasma ions and electrons, the mirror ratio, and the plasma radius. 83 refs., 58 figs.

**38326 (DOE/ET/51013—206) Studies of the regime of improved particle and energy confinement following pellet injection into Alcator C.** Greenwald, M.; Besen, M.; Camacho, F.; Fiore, C.; Foord, M.; Gandy, R.; Gomez, C.; Granetz, R.; Gwinn, D.; Knowlton, S. (Massachusetts Inst. of Tech., Cambridge (USA). Plasma Fusion Center). Nov 1986. Contract AC02-78ET51013. 20p. (PFC/CP—86-20; CONF-861106—27; IAEA-CN—47/A-III-1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010005.

From IAEA international conference on plasma physics and controlled nuclear fusion research; Kyoto, Japan (12 Nov 1986).

Pellet fueling in Alcator C can result in a plasma regime in which both energy and particle confinement are dramatically improved. In this regime ion thermal losses (highly anomalous in gas fueled plasma) are reduced to approximately neo-classical values resulting in increased global energy confinement for high density discharges where ion losses are important. There is little or no change in electron thermal conductivity. The pellet fueled discharges exhibit peaked density profiles, which tends to confirm the importance of the eta/sub i/ parameters determining ion thermal diffusivity. At the same time, impurity particle transport is reduced to neo-classical levels leading to accumulation of impurities and strong peaking of impurity profiles. Confinement of the hydrogenic species in the discharges core is also increased. The modification of ion-thermal, central particle, and impurity transport are well correlated; there are no discharges where only one or two of these change. In the favorable transport regime, sawteeth are partially or completely suppressed. This is likely due to the strong peaking of low Z impurities which flatten the central current profile by increasing the plasma resistivity. Radiation does not play an important role in the power balance of these discharges. For plasmas in which the sawteeth are suppressed the improved confinement is sustained for the remainder of the discharge.

**38327 (DOE/ET/51013—218) Modeling of ICRH experiments in the Tara tandem mirror.** Myer, R.C.; Golovato, S.N. (Massachusetts Inst. of Tech., Cambridge (USA). Plasma Fusion Center). May 1987. Contract AC02-78ET51013. 9p. (PFC/CP—87-6; CONF-870570—15). NTIS, PC A02. File Number DE87011033.

From 7. topical conference on applications of radio-frequency power to plasmas; Kissimmee, FL, USA (4 May 1987).

The production and heating of the central cell plasma in Tara are provided by a slot antenna located on the midplane bump of the axial magnetic field profile. Slow ion cyclotron waves excited by the slot propagate down a magnetic beach to ion cyclotron resonance layers located on either side of the bump where the rf power is strongly damped by the ions. Two different theoretical models are being used to study the efficiency of coupling to slow waves in this configuration. Wave propagation models which are based on the infinite plasma dispersion relation for a cold plasma indicate that radially propagating left hand polarized slow waves are converted to right hand polarized fast waves at the Alfven resonance layer due to the radial density gradient. If this were to occur we would expect a lower coupling efficiency to the ions in

the plasma core. On the other hand, a nonlocal kinetic model of rf wave propagation in a nonuniform plasma slab indicates that a significant left hand component of the electric field extends beyond the Alfven resonance layer. Preliminary experimental measurements of the radial inductive field profile agree qualitatively with the predictions of the cold plasma model, however, there is insufficient data at this time to establish that a density limit for slow wave accessibility to the plasma core exists.

38328 **(DOE/ET/51013—221) Fast-wave transmission and reflection in ion-cyclotron heating.** Fuchs, V.; Lashmore-Davies, C.N.; Francis, G.; Ram, A.K.; Bers, A. (Massachusetts Inst. of Tech., Cambridge (USA). Plasma Fusion Center). May 1987. Contract AC02-78ET51013. 5p. (PFC/CP—87-9; CONF-870570—18). NTIS, PC A02/MF A01; GPO Dep. File Number DE87011036.

From 7. topical conference on applications of radio-frequency power to plasmas; Kissimmee, FL, USA (4 May 1987).

A second-order differential equation for the ion-cyclotron fast wave propagating in a hot, two ion species plasma is obtained. The equation includes the effects of both minority fundamental and majority second harmonic cyclotron damping. The approximation is based upon replacing the coupling to the ion Bernstein wave by a modified propagation description of the fast wave. For the case of perpendicular propagation, the second order equation reduces to the Budden equation giving the well known transmission coefficient for both two ion hybrid and second harmonic resonance. The solutions of the second order equation as a function of n/sub parallel/ give transmission and reflection coefficients which agree very well with the results based on models using higher order differential equations.

38329 **(DOE/ET/53088—213) Effects of ballooning instability on tokamak confinement.** Fu, Guoyong; Van Dam, J.W. (Texas Univ., Austin (USA). Inst. for Fusion Studies). May 1987. Contract FG05-80ET53088. 29p. (IFSR—213). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87010764.

Using the ballooning mode transport model proposed by Connor, Taylor, and Turner (1984), the thermal conductivity induced by ideal ballooning instability is derived and compared to experimental observations from auxiliary-heated tokamaks. It is shown how this model can be improved by means of a finite-beta equilibrium and also applied to obtain a confinement scaling law for high-beta, purely ohmically heated tokamaks. Finally, this transport model is employed to find that tokamaks with supplemental stabilization, for example, due to gyroradius, energetic particle, or shaping effects, can self-consistently access the second stability regime at rather high heating power.

38330 **(DOE/ET/53088—254) Confinement of a self-stabilized tokamak under average magnetic well conditions.** Demchenko, V.V.; Fu, G.Y.; Van Dam, J.W. (Texas Univ., Austin (USA). Inst. for Fusion Studies). May 1987. Contract FG05-80ET53088. 10p. (IFSR—254). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010765.

It is well known that the average favorable magnetic curvature of a tokamak is stabilizing with respect to pressure-driven magnetohydrodynamic instabilities at low beta and that self-stabilization occurs at finite beta in the so-called second stability regime. Here we self-consistently investigate how these two effects, viz., the mean magnetic well and the self-stabilization, influence the energy confinement time in a tokamak, using the ballooning mode transport model.

38331 **(DOE/ET/53088—275) Plasma current sustained by fusion charged particles in a field reversed configuration.** Berk, H.L.; Momota, H.; Tajima, T. (Texas Univ., Austin (USA). Inst. for Fusion Studies). Apr 1987. Contract FG05-80ET53088. 79p. (IFSR—275). NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87010788.

The distribution of energetic charged particles generated by thermonuclear fusion reactions in a field reversed configuration (FRC) are studied analytically and numerically. A fraction of the charged fusion products escapes directly while the others are trapped to form a directed particle flow parallel to the plasma current. It is shown that the resultant current density produced by these fusion charged particles can be comparable to background plasma current density that produces the original field reversed configuration in a D-$^3$He reactor. Self-consistent equilibria arising from the currents of the background plasma and proton fusion products are constructed where the Larmor radius of the fusion product is of arbitrary size. Reactor relevant parameters are examined, such as how the fusion reactivity rate varies as a result of supporting the pressure associated with the fusion products. We also model the synchrotron emission from various pressure profiles and quantitatively show how synchrotron losses vary with different pressure profiles in an FRC configuration.

38332 **(DOE/ET/53088—276) Nonlinear dynamics of tearing modes in the reversed field pinch.** Holmes, J.A.; Carreras, B.A.; Diamond, P.H.; Lynch, V.E. (Texas Univ., Austin (USA). Inst. for Fusion Studies; Oak Ridge National Lab., TN (USA)). May 1987. Contract FG05-80ET53088;AC05-84OR21400. 49p. (IFSR—276). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87010766.

The results of investigations of nonlinear tearing-mode dynamics in reversed field pinch plasmas are described. The linear instabilities have poloidal mode number $m = 1$ and toroidal mode numbers $10 \leqq n \leqq 20$, and the resonant surfaces are therefore in the plasma core. The nonlinear dynamics result in dual cascade processes. The first process is a rapid $m = 1$ spectral broadening toward high n, with a simultaneous spreading of magnetic turbulence radially outward toward the field-reversal surface. Global $m = 0$ perturbations, which are driven to large amplitudes by the $m = 1$ instabilities, in turn trigger the $m = 1$ spectral broadening by back-coupling to the higher n. The second process is a cascade toward large m and is mediated by $m = 2$ modes. The $m = 2$ perturbations have the structure of localized, driven current sheets and nonlinearly stabilize the $m = 1$ modes by transferring $m = 1$ energy to small-scale dissipation. The calculated spectrum has many of the qualitative features observed in experiments. 13 refs., 21 figs., 1 tab.

38333 **(DOE/ET/53088—277) Orbit extension method for finding unstable orbits.** Chen, Q.; Meiss, J.D.; Percival, I.C. (Texas Univ., Austin (USA). Inst. for Fusion Studies; Queen Mary Coll., London (UK). School of Mathematics). May 1987. Contract FG05-80ET53088. 28p. (IFSR—277). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87010767.

The orbit extension method is a technique for building long orbits from shorter ones. Combined with Newton's method, it gives a powerful and efficient tool for finding various orbits of area-preserving twist maps on a cylinder. It is particularly valuable for unstable orbits. This method is developed and used to find two kinds of orbits: ordered periodic orbits and principal heteroclinic orbits between two resonances. Flux from one resonance to another is obtained as a by-product of the principal heteroclinic orbits.

38334 **(DOE/ET/53088—279) Low beta rigid mode stability criterion for an arbitrary Larmor radius plasma.** Berk, H.L.; Wong, H.V. (Texas Univ., Austin (USA). Inst. for Fusion Studies). May 1987. Contract FG05-80ET53088. 34p. (IFSR—279). NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87010768.

The low beta flute interchange dispersion relation for rigid displacement perturbation of axisymmetric plasma equilibria with arbitrary Larmor radius particles and field line curvature, large compared to the plasma radius, is derived. The equilibrium particle orbits are characterized by two constants of motion, energy and angular momentum, and a third adiabatic invariant derived from the rapid radial motion. The Vlasov equation is integrated, assuming that the mode frequency, axial "bounce" frequency, and particle drift frequency are small compared to the cyclotron frequency, and it is demonstrated that the plasma response to a rigid perturbation has a universal character independent of Larmor radius. As a result the interchange instability is the same as that predicted from conventional MHD theory. However, a new prediction, more optimistic than earlier work, is found for the low density threshold of systems like Migma, which are disc-shaped, that is, the axial extent $\Delta z$

is less than the radial extent $r_0$. For $\Delta z/sub\ r_0/$ much less than 1, the stability criterion is determined by the total particle number. Whereas the older theory ($\Delta z/sub\ r_0/$ much greater than 1) predicted instability at about the densities achieved in actual Migma experiments, the present theory ($\Delta z/sub\ r_0/$ much less than 1) indicates that the experimental results were for plasmas with particle number below the interchange threshold.

**38335 (ENEA-RT-FUS—86-12) Calculations of total fusion power and spatial distribution of emissivity for a D-T thermal plasma. Part I.** Batistoni, P. (ENEA, Rome (Italy)). Mar 1987. 17p. NTIS (US Sales Only), PC A02/MF A01. File Number DE87752640.

The feasibility of a neutron emissivity profile monitor for NET (Next European Torus) is investigated by means of a Monte Carlo code that simulates the neutron emission of a burning plasma within the NET configuration and assuming an ideal neutron diagnostic tool (a set of five horizontal collimators). The numerical values are treated as experimental data which are analyzed and inverted with several procedures in order to obtain the emissivity profile and to evaluate the total fusion power. The results show that the multicollimator design assumed in this preliminary work is inadequate to achieve the required accuracy and to fit the theoretical profiles. Suggestions are given to improve the conceptual design of the profile monitor for NET.

**38336 (EUR—9618-Vol.2, pp 419-426) Linear helical-axis stellarator experiments.** Ribe, F.L.; Greenfield, C.M.; Hedin, E.R.; Koepke, M.E. 1985. NTIS (US Sales Only), PC A17/MF A01. File Number DE87751804. (CONF-8409392—Vol.2).

From IAEA technical committee meeting on plasma confinement and heating in stellarators; Schloss Ringberg, F.R. Germany (24 Sep 1984).

We report research on straight, helical-axis , high-beta stellarator. Plasma configurations are generated by a 90 kV, 16 kJ 3-meter $\theta$ pinch (the High Beta Q Machine). The object is to study equilibrium and stability of the linear Heliac and also the simpler 1 = 1 stellarator. Initial experimental results are reported.

**38337 (GA-A—18775) Polarization change of electron cyclotron waves by reflection.** Hsu, Jang-Yu; Moeller, C.P. (GA Technologies, Inc., San Diego, CA (USA)). Apr 1987. Contract AC03-84ER53158. 7p. (CONF-870570—2). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87009301.

From 7. topical conference on applications of radio-frequency power to plasmas; Kissimmee, FL, USA (4 May 1987).

Given that the wave numbers of X and O modes merges as they approach the plasma boundary, a pure mode reflected from the plasma by a cut off may excite both modes due to polarization change when it is reflected off the vacuum vessel wall since the tangential components of the electric field change sign. This may explain the good central heating in DIII-D ECH experiments in which the fundamental X-mode is launched from the low field side.

**38338 (IPP—III-117) Investigation of density fluctuations in the edge region of the divertor tokamak ASDEX.** Rudyj, A. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). Jan 1987. 105p. (In German). NTIS, PC E11; Available from NTIS as TIB/B87-07050.

Stochastic density fluctuations occur in the plasma edge in a frequency range up to some 100 kHz. In regions with a high enough neutral gas density they are visible as a fluctuating band structure. On the divertor tokamak ASDEX these fluctuations are examined with the aid of photomultipliers connected to a variable arrangement of 8 light conductors whose inputs are projected on the plasma surface in the midplane. The analogue signals are digitised and then evaluated by spectral and correlation analysis. Radial resolution is realized by optical observations of a neutral Li-beam. In the ohmic discharges the detected plasma light demonstrates smooth power density spectra decreasing continuously to the highest observed frequency of 30 kHz. The fluctuations are well correlated along the magnetic field lines; perpendicularly, the correlation length is about 1.5 cm. They move with nearly the electron drift velocity. The fluctuations in the observed frequency range are located radially outside of the separatrix and have their origin at the outer surface of the torus. Drift wave turbulence is probably responsible for these phemomena.

**38339 (KMSF-U—1566) Alcator pellet evaporation data and the classical flux limit parameter.** Mayer, F.J.; Parker, J.K. (KMS Fusion, Inc., Ann Arbor, MI (USA); Massachusetts Inst. of Tech., Cambridge (USA). Plasma Fusion Center). 21 Feb 1985. Contract AC05-84OR21400. 11p. NTIS, PC A02/MF A01; GPO Dep. File Number DE87010884.

The steady-state, spherically symmetric, evaporation theory of Cowie and McKee is applied to recent well characterized pellet evaporation experiments at Alcator. A best "fit" to both low density and high density plasmas is obtained with the flux-limit parameter, f = 1, which implies fully-saturated electron heat flow throughout the pellet evaporation.

**38340 (LA-UR—87-1544) High density Z pinch formed from a solid deuterium fiber.** Hammel, J.E.; Scudder, D.W. (Los Alamos National Lab., NM (USA)). 1987. Contract W-7405-ENG-36. 5p. (CONF-870629—6). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010108.

From 14. European conference on controlled fusion and plasma physics; Madrid, Spain (22 Jun 1987).

Experiments in which 250 kA have been passed through a z-pinch column formed from a thin fiber of cryogenic solid deuterium have demonstrated unexpectedly stable behavior. It has been shown that it is possible to maintain a z pinch in near radial equilibrium while it is ohmically heated from 16°K to several hundred eV. These results have motivated an effort to increase the plasma current to 1 MA and above, giving the potential of producing reactor-relevant plasmas capable of significant thermonuclear burn. Such a megamp experiment has been designed, partially fabricated, and successfully tested with an existing generator.

**38341 (LA-UR—87-1561) Field-reversed configuration formation and confinement studies on the LSM device.** Siemon, R.E.; Barnes, G.A.; Chrien, R.E.; Hugrass, W.N.; Ito, Y.; Rej, D.J.; Tuszewski, M.; Wright, B. (Los Alamos National Lab., NM (USA)). 1987. Contract W-7405-ENG-36. 5p. (CONF-870629—5). NTIS, PC A02. File Number DE87010110.

From 14. European conference on controlled fusion and plasma physics; Madrid, Spain (22 Jun 1987).

This report gives information concerning testing of the LSM upgrade of the FRX-C/T device. Results of plasma confinement experiments are given. (JDH)

**38342 (LBL—23299) Congruent reduction and mode conversion in 4-dimensional plasmas.** Friedland, L.; Kaufman, A.N. (Lawrence Berkeley Lab., CA (USA)). Apr 1987. Contract AC03-76SF00098. 7p. (CONF-870570—10). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010263.

From 7. topical conference on applications of radio-frequency power to plasmas; Kissimmee, FL, USA (4 May 1987).

Standard eikonal theory reduces, to N=1, the order of the system of equations underlying wave propagation in inhomogeneous plasmas. The condition for this remarkable reducibility is that only one eigenvalue of the unreduced NxN dispersion matrix D(k,x) vanishes at a time. If, however, two or more eigenvalues of D become simultaneously small, the geometric optics reduction scheme becomes singular. These regions are associated with linear mode conversion, and are described by higher order systems. A new reduction scheme based on congruent transformations of D is developed, and it is shown that, in "degenerate" plasma regions, a partial reduction of order is possible. The method comprises a constructive step-by-step procedure, which, in the most frequent (doubly) degenerate case, yields a second order system, describing the pairwise mode conversion problems, the solution of which in general geometry has been found recently.

38343 **(N—87-21684) Plasma physics abstracts, 1 January - 31 December, 1986.** Gurnett, D.A.; Dangelo, N.; Goertz, C.K. (Iowa Univ., Iowa City (USA)). May 1987. 20p. (NASA-CR—180220; NAS—1.26:180220). NTIS, PC A02/MF A01.

Topics addressed include: ion-cyclotron waves; plasma waves; solar wind lithium releases; bow shock; Pi2 wave bursts; auroral kilometric radiation; ion energization; magnetic field corrections; electric fields; magnetospheric processes; electron acceleration; inner heliosphere; nightside auroral zone; computerized simulation; plasma wave turbulence; and magnetohydrodynamic waves in plasma sheets.

38344 **(PPPL—2368) Transport simulations of ohmic TFTR experiments with profile-consistent microinstability-based models for chi/sub e/ and chi/sub i/.** Redi, M.H.; Tang, W.M.; Efthimion, P.C.; Mikkelsen, D.R.; Schmidt, G.L. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Mar 1987. Contract AC02-76CH03073. 55p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87010626.

Transport simulations of ohmically heated TFTR experiments with recently developed profile-consistent microinstability models for the anomalous thermal diffusivities, chi/sub e/ and chi/sub i/, give good agreement with experimental data. The steady-state temperature profiles and the total energy confinement times, tau/sub e/, were found to agree for each of the ohmic TFTR experiments simulated, including three high radiation cases and two plasmas fueled by pellet injection. Both collisional and collisionless models are tested. The trapped-electron drift wave microinstability model results are consistent with the thermal confinement of large plasma ohmic experiments on TFTR. We also find that transport due to the toroidal ion temperature gradient (eta/sub i/) modes can cause saturation in tau/sub E/ at the highest densities comparable to that observed on TFTR and equivalent to a neoclassical anomaly factor of 3. Predictions based on stabilized eta/sub i/-mode-driven ion transport are found to be in agreement with the enhanced global energy confinement times for pellet-fueled plasmas. 33 refs., 26 figs., 4 tabs.

38345 **(PPPL—2400) An algorithm for the calculation of 3-D ICRF [Ion Cyclotron Range of Frequencies] fields in tokamak geometry.** Smithe, D.N.; Colestock, P.L.; Kashuba, R.J.; Kammash, T. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Apr 1987. Contract AC02-76CH03073. 78p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87010627.

A computational scheme is developed which permits tractable calculation of three-dimensional full-wave solutions to the Maxwell-Vlasov equations under typical Ion Cyclotron Range of Frequencies (ICRF) experimental conditions. The method is unique in that power deposition to the plasma is determined via the anti-Hermitian part of a truncated warm-plasma dielectric operator, rather than as the result of an assumed phenomenological collision frequency. The resulting computer code allows arbitrary variation of density, temperature, magnetic field, and minority concentration in the poloidal plane by performing a convolution of poloidal modes to produce a coupled system of differential equations in the radial variable. By assuming no inhomogeneity along the toroidal axis, an inverse transform over k/sub parallel/ is performed to yield the full three-dimensional field solutions. The application of the code to TFTR-like plasmas shows a mild resonance structure in antenna loading related to the changing number of wavelengths between antenna and the resonance layer. 48 figs.

38346 **(PPPL—2402) Tokamak physics studies using x-ray diagnostic methods.** Hill, K.W.; Bitter, M.; von Goeler, S.; Beiersdorfer, P.; Fredrickson, E.; Hsuan, H.; McGuire, K.; Sauthoff, N.R.; Sesnic, S.; Stevens, J.E. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Mar 1987. Contract AC02-76CH03073. 69p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87010628.

X-ray diagnostic measurements have been used in a number of experiments to improve our understanding of important tokamak physics issues. The impurity content in TFTR plasmas, its sources and control have been clarified through soft x-ray pulse-height analysis (PHA) measurements. The dependence of intrinsic impurity concentrations and Z/sub eff/ on electron density, plasma current, limiter material and conditioning, and neutral-beam power have shown that the limiter is an important source of metal impurities. Neoclassical-like impurity peaking following hydrogen pellet injection into Alcator C and a strong effect of impurities on sawtooth behavior were demonstrated by x-ray imaging (XIS) measurements. Rapid inward motion of impurities and continuation of $m = 1$ activity following an internal disruption were demonstrated with XIS measurements on PLT using injected aluminum to enhance the signals. Ion temperatures up to 12 keV and a toroidal plasma rotation velocity up to $6 \times 10^5$ m/s have been measured by an x-ray crystal spectrometer (XCS) with up to 13 MW of 85-keV neutral-beam injection in TFTR. Precise wavelengths and relative intensities of x-ray lines in several helium-like ions and neon-like ions of silver have been measured in TFTR and PLT by the XCS. The data help to identify the important excitation processes predicted in atomic physics. Wavelengths of $n = 3$ to 2 silver lines of interest for x-ray lasers were measured, and precise instrument calibration techniques were developed. Electron thermal conductivity and sawtooth dynamics have been studied through XIS measurements on TFTR of heat-pulse propagation and compound sawteeth. A non-Maxwellian electron distribution function has been measured, and evidence of the Parail-Pogutse instability identified by hard x-ray PHA measurements on PLT during lower-hybrid current-drive experiments.

38347 **(PPPL—2419) High-pressure duo-multichannel soft x-ray spectrometer for tokamak plasma diagnostics.** Schwob, J.L.; Wouters, A.W.; Suckewer, S. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Mar 1987. Contract AC02-76CH03073. 61p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87010629.

A high-resolution, time-resolving soft X-ray multichannel spectrometer (SOXMOS) that permits the simultaneous measurement of emission in two different spectral ranges has been developed and tested extensively for tokamak plasma diagnostics. The basic instrument is a high-resolution, interferometrically adjusted, extreme grazing incidence Schwob-Fraenkel duochromator. The instrument is equipped with two multichannel detectors that are adjusted interferometrically and scan along the Rowland circle. Each consists of an $MgF_2$ coated, funneled microchannel plate, associated with a phosphor screen image intensifier that is coupled to a 1024-element photodiode array by a flexible fibrer optic conduit. The total wavelength coverage of the instrument is 5 to 340° A with a measured resolution (FWHM) of about 0.2 A when equipped with a 600 g/mm grating, and 5 to 85 A with a resolution of about 0.06 A using a 2400 g/mm grating. The simultaneous spectral coverage of each detector varies from 15 A at the short wavelength limit to 70 A at the long wavelength limit with the lower dispersion grating. The minimum read-out time for a full spectral portion is 17 ms, but several individual lines can be measured with 1 ms time resolution by selected pixel readout. Higher time resolution can be achieved by replacing one multichannel detector with a single channel electron multiplier detector. Examples of data from the PLT and TFTR tokamaks are presented to illustrate the instrument's versatility, high spectral resolution, and high signal-to-noise ratio even in the 10 A region. 44 refs., 20 figs.

38348 **(PPPL—2420) Ideal MHD stability properties of pressure-driven modes in low shear tokamaks.** Manickam, J.; Pomphrey, N.; Todd, A.M.M. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Mar 1987. Contract AC02-76CH03073. 42p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87010630.

The role of shear in determining the ideal MHD stability properties of tokamaks is discussed. In particular, we assess the effects of low shear within the plasma upon pressure-driven modes. The standard ballooning theory is shown to break down, as the shear is reduced and the growth rate is shown to be an oscillatory function of n, the toroidal mode number, treated as a continuous parameter. The oscillations are shown to depend on both the pressure and safety-factor profiles. When the shear is sufficiently weak, the oscillations can result in bands of unstable n values which are present even when the standard ballooning theory predicts complete stability. These instabilities are named "infernal modes." The occurrence of these instabilities at integer n is shown to be a sensi-

tive function of q-axis, raising the possibility of a sharp onset as plasma parameters evolve. 20 refs., 31 figs.

38349 **(PPPL—2422) Rigorous upper bounds for transport due to passive advection by inhomogeneous turbulence.** Krommes, J.A.; Smith, R.A. (Princeton Univ., NJ (USA). Plasma Physics Lab.). May 1987. Contract AC02-76CH03073. 91p. NTIS, PC A05/MF A01; 1; GPO Dep. File Number DE87010632.

A variational procedure, due originally to Howard and explored by Busse and others for self-consistent turbulence problems, is employed to determine rigorous upper bounds for the advection of a passive scalar through an inhomogeneous turbulent slab with arbitrary generalized Reynolds number R and Kubo number K. In the basic version of the method, the steady-state energy balance is used as a constraint; the resulting bound, though rigorous, is independent of K. A pedagogical reference model (one dimension, $K = \infty$) is described in detail; the bound compares favorably with the exact solution. The direct-interaction approximation is also worked out for this model; it is somewhat more accurate than the bound, but requires considerably more labor to solve. For the basic bound, a general formalism is presented for several dimensions, finite correlation length, and reasonably general boundary conditions. Part of the general method, in which a Green's function technique is employed, applies to self-consistent as well as to passive problems, and thereby generalizes previous results in the fluid literature. The formalism is extended for the first time to include time-dependent constraints, and a bound is deduced which explicitly depends on K and has the correct physical scalings in all regimes of R and K. Two applications from the theory of turbulent plasmas ae described: flux in velocity space, and test particle transport in stochastic magnetic fields. For the velocity space problem the simplest bound reproduces Dupree's original scaling for the strong turbulence diffusion coefficient. For the case of stochastic magnetic fields, the scaling of the bounds is described for the magnetic diffusion coefficient as well as for the particle diffusion coefficient in the so-called collisionless, fluid, and double-streaming regimes.

38350 **(PPPL—2424) Eigenmode analysis of compressional waves in the magnetosphere.** Cheng, C.Z.; Lin, C.S. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Apr 1987. Contract AC02-76CH03073. 17p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010633.

A field-aligned eigenode analysis of compressional Alfven instabilities has been performed for a two component anisotropic plasma in a dipole magnetic field. The eigenmode equations are derived from the gyrokinetic equations in the long wavelength (k rho $<$ 1) and low frequency ($\omega <$ $\omega$/sub b/) limits, where rho is the hot particle gyroradius and $\omega$/sub b/ is the hot particle bounce frequency. Two types of compressional instabilities are identified. One is the drift mirror mode which has an odd parity compressional magnetic component with respect to the magnetic equator. The other is the drift compressional mode with an even parity compressional magnetic component. For typical storm time plasma parameters neargeosynchronous orbit, the drift mirror mode is most unstable and the drift compressional mode is stable. The storm time compressional Pc 5 waves, observed by multiple satellites during November 14-15, 1979 [Takahashi et al., 1987], can be explained by the drift mirror instability.

38351 **(PPPL—2425) Energy confinement and profile consistency in TFTR.** Goldston, R.J.; Arunasalan, V.; Bell, M.G.; Bitter, M.; Blanchard, W.R.; Bretz, N.L.; Budny, R.; bush, C.E.; Callen, J.D.; Cohen, S.A. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Apr 1987. Contract AC02-76CH03073. 18p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010634.

A new regime of enhanced energy confinement has been observed on TFTR with neutral beam injection at low plasma current. It is characterized by extremely peaked electron density profiles and broad electron temperature profiles. The electron temperature profile shapes violate the concept of profile consistency in which T/sub e/(O)/$<$T/sub e/$>$/sub v/ is assumed to be a tightly constrained function of q/sub a/, but they are in good agreement with a form of profile consistency based on examining the temperature profile shape outside the plasma core. The enhanced confinement regime is only obtained with a highly degassed limiter; in discharges with gas-filled limiters convective losses are calculated to dominate the edge electron power balance. Consistent with the constraint of profile consistency, global confinement is degraded in these cases. The best heating results in the enhanced confinement regime are obtained with nearly balanced co- and counter-injection. Much of the difference between balanced and co-only injection can be explained on the basis of classically predicted effects associated with plasma rotation.

38352 **(PPPL—2427) Vectorizing and macrotasking Monte Carlo neutral particle algorithms.** Heifetz, D.B. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Apr 1987. Contract AC02-76CH03073. 23p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010635.

Monte Carlo algorithms for computing neutral particle transport in plasmas have been vectorized and macrotasked. The techniques used are directly applicable to Monte Carlo calculations of neutron and photon transport, and Monte Carlo integration schemes in general. A highly vectorized code was achieved by calculating test flight trajectories in loops over arrays of flight data, isolating the conditional branches to as few a number of loops as possible. A number of solutions are discussed to the problem of gaps appearing in the arrays due to completed flights, which impede vectorization. A simple and effective implementation of macrotasking is achieved by dividing the calculation of the test flight profile among several processors. A tree of random numbers is used to ensure reproducible results. The additional memory required for each task may preclude using a larger number of tasks. In future machines, the limit of macrotasking may be possible, with each test flight, and split test flight, being a separate task.

38353 **(PPPL—2431) Gyrokinetic particle simulation of ion temperature gradient drift instabilities.** Lee, W.W.; Tang, W.M. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Apr 1987. Contract AC02-76CH03073. 44p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87010636.

Ion temperature gradient drift instabilities have been investigated using gyrokinetic particle simulation techniques for the purpose of identifying the mechanisms responsible for their nonlinear saturation as well as the associated anomalous transport. For simplicity, the simulation has been carried out in a shear-free slab geometry, where the background pressure gradient is held fixed in time to represent quasistatic profiles typical of tokamak discharges. It is found that the nonlinearly generated zero-frequency responses for the ion parallel momentum and pressure are the dominant mechanisms giving rise to saturation. This is supported by the excellent agreement between the simulation results and those obtained from mode coupling calculations.

38354 **(SFB—162-85-04-141) Kinetics of excitation and ionization of Be I in tokamak devices.** Stefanov, B.; Zarkova, L.; Bessenrodt-Weberpals, M.; Hackmann, J.; Uhlenbusch, J. (Bochum Univ. (Germany, F.R.). Sonderforschungsbereich 162 - Plasmaphysik Bochum/Juelich; Duesseldorf Univ. (Germany, F.R.). Physikalisches Inst. - Lehrstuhl 2). Aug 1985. 21p. NTIS, PC E07; Available from NTIS as TIB/B87-06947.

Excitation and ionization of beryllium (Be) atoms sputtered from a Be-limiter and penetrating a tokamak discharge are investigated. Three models are considered: (a) ionization from the ground state neglecting excited states; (b) a five-level (2/sup 1/S, 2/sup 3/P, 2/sup 1/P, 3/sup 3/S, and 3/sup 1/S) model; (c) a simplified five-level model with strong collisional-radiative coupling between higher and lower levels. The results show a coincidence between models (b) and (c) in calculating the distributions of level populations along the minor radius of the torus. At distances larger than 1.3 cm from the limiter, the population of the metastable 2/sup 3/P level exceeds the ground state population. Therefore at large distances from the limiter the 332.1 nm line of Be I may happen to suit better the diagnostics of Be-impurities than the resonant 234.9 nm line.

38355 **(UCLA/PPG—1070) Ray tracing analysis of LH [lower hybrid] fast waves in CCT [Continuous Current Tokamak].** Mau, T.K.; Lai, K.F.; Taylor, R.J. (California Univ., Los Angeles (USA). Tokamak Fusion Lab.). May 1987. Contract FG03-86ER52130;FG03-86ER53225. 6p. (CONF-870570—13). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010296.

From 7. topical conference on applications of radio-frequency power to plasmas; Kissimmee, FL, USA (4 May 1987).

Lower hybrid fast wave field profiles have been measured in the CCT tokamak. These field maps exhibit characteristics of large n/sub parallel/ wave components, with n/sub perpendicular//n/sub parallel/ $\cong$ 1, and the wave energy appears to be heavily damped in the toroidal direction. We use a 3-D toroidal ray tracing code to study this wave behavior. The spectral filtering of the fast wave can be partially attributed to mode conversion to the slow wave for the low n/sub parallel/ components. In most parameter regimes, subsequent strong absorption of the converted slow wave via electron Landau and higher harmonic ion damping results.

38356 **(UCRL—94086) Direct implicit electromagnetic plasma simulation.** Hewett, D.W.; Langdon, A.B. (Lawrence Livermore National Lab., CA (USA)). 6 May 1986. Contract W-7405-ENG-48. 6p. (CONF-860515—5). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87009603.

From EPS conference on computational physics - computing in plasma physics; Partenkirchen, F.R. Germany (13 May 1986).

The essence of any implicit PIC (particle-in-cell) algorithm is to use part of the future fields in the evolution of the particle/field equations so that stability with a large time step can be maintained. The big impediment in developing implicit methods for PIC techniques has been the difficulty of solving the field rapidly and robustly in the parameter regimes of general interest. We describe here a new implementation of the Direct Implicit algorithm with a field solution that greatly reduces these concerns.

38357 **Measurement of the local particle diffusion coefficient in a magnetized plasma.** Levinton, F.M.; Meyerhofer, D.D. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Review of Scientific Instruments;* **58**: No. 8, 1393-1400(Aug 1987).

Local impurity particle diffusion coefficients have been measured in a low temperature plasma by the injection of test particles at the center of the plasma. The injection is accomplished by a high-voltage discharge between two small graphite electrodes on a probe. The probe can be located anywhere in the plasma. The diffusion is observed spectroscopically. An analysis of the spatial and temporal evolution of the C II radiation from the carbon discharge can determine the parallel and perpendicular diffusion of the impurity ions. Results with the diagnostic have been obtained in the Proto S-1/C spheromak. The measured value of the diffusion coefficient in the afterglow plasma is in good agreement with classical predictions.

38358 **Effect of trapped electrons on current drive.** Cohen, R.H. (Lawrence Livermore National Laboratory, Livermore, California 94550). *Physics of Fluids;* **30**: No. 8, 2442-2449(Aug 1987). Contract W-7405-ENG-48.

Trapped-particle effects on electron—cyclotron resonance heating (ECRH) and lower-hybrid current drive are studied using the adjoint formalism. A square-well model for the collision operator is used to obtain an analytic form for the Green's function that is shown to be quite accurate. In constructing the current, the wave-heated distribution function is allowed to have an effective temperature along the velocity-space resonance curve that is different from the bulk temperature of the scattering electrons. These calculations are used to illustrate the deleterious effect of heating on the outside of a flux surface. Relativity and strong heating are each shown to increase current-drive efficiency for heating on the inside of the flux surface with Yequivalentharmonic number x cyclotron frequency/wave frequency less than 1, and decrease or reverse the driven current in the opposite limits. A significant limit on ECRH current drive in a mildly relativistic plasma, resulting from an upper bound on the minimum resonant energy, is demonstrated.

38359 **Anomalous current penetration and oscillating current drive in tokamaks.** Finn, J.M.; Antonsen T.M. Jr. (Laboratory for Plasma and Fusion Energy Studies, University of Maryland, College Park, Maryland 20742). *Physics of Fluids;* **30**: No. 8, 2450-2456(Aug 1987).

A current drive scheme for tokamaks, involving oscillating the Ohmic heating (OH) circuit, is proposed. This scheme is based upon the experimentally observed anomalous skin penetration during the start-up phase of tokamaks. Analytic and numerical results indicating feasibility are shown and scaling of steady-state current and power dissipated with frequency and plasma resistivity is presented. An explanation is given of why this scheme should work, in spite of the fact that the external circuit supplies no magnetic helicity. This scheme is potentially more efficient in terms of current generated per unit power dissipated than other current drive schemes. It is shown that a resistive magnetohydrodynamic (MHD) activity responsible for anomalous current penetration, and therefore required for the success of this current drive scheme, must be fully three dimensional. Finally, a comparison of the effectiveness of this scheme with that of F-$\Theta$ pumping in reversed-field pinches (RFP's) is presented.

38360 **Limits on the cross-field propagation of streams of cold plasma.** Borovsky, J.E. (Space Plasma Physics Group, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physics of Fluids;* **30**: No. 8, 2518-2526(Aug 1987).

When injected across an ambient magnetic field, a stream of collisionless plasma polarizes, and the resulting polarization electric field may allow the stream to penetrate the magnetic field. The polarization charge spreads from the stream sides along the magnetic-field lines and any ambient plasma that is magnetically connected to the stream will be picked up to form Alfven wings of co-moving plasma. As the stream and wing plasmas move across the magnetic field, their outer edges are continually stripped off. Because of these processes, the stream must expend charge, momentum, and kinetic energy in order to continue its cross-field motion. These expenditures derive from five requirements of charge from the stream: charge is required (1) to polarize the stream plasma, (2) to replace the charge stripped from the stream's edges as it propagates, (3) to set up the Alfven wings on the stream, (4) to replace the charge stripped from the sides of the wings as they propagate, and (5) to supply any conduction currents in the ambient plasma. By using idealized stream configurations, approximate limits on the propagation distance are obtained.

38361 **Plasma formation and equilibrium in a high $\beta$ tokamak.** Deniz, A.V.; Li, X.L.; Marshall, T.C. (Department of Applied Physics and Nuclear Engineering, Columbia University, New York, New York 10027). *Physics of Fluids;* **30**: No. 8, 2527-2537(Aug 1987).

The formation and equilibrium of a high $\beta$ tokamak in the Columbia High Beta Tokamak (HBT) (Plasma Physics and Controlled Nuclear Fusion Research 1986, in press) is documented using magnetic probes as the principle diagnostic. The formation from a toriodal field stabilized Z pinch is simulated with 2-D resistive magnetohydrodynamic (MHD) equations. From the measurement of the magnetic field by high-impedence internal magnetic probes, the poloidal flux, toroidal current, and safety factor are calculated. In addition, the plasma position and cross-sectional shape are determined. The tokamak has a major radius of about 0.24 m, a minor radius of about 0.05 m, and a toroidal current density of about $10^6$ A/m$^2$. The high $\beta$ tokamak plasma is observed to have an outward shift in major radius of both the magnetic center and the peak of the toroidal current density. The magnetic center moves inward in major radius after 20—30 $\mu$sec, presumably because the plasma maintains major radial equilibrium as its pressure decreases because of the radiation of impurity atoms.

38362 **Resistive-heating instability of a compressible, force-free plasma.** Sparks, L.; Van Hoven, G. (Department of Physics, University of California, Irvine, California 92717). *Physics of Fluids;* **30**: No. 8, 2470-2476(Aug 1987).

The thermal stability of a resistive, force-free plasma in a two-dimensional, slab geometry is investigated numerically. Linear-

ly unstable modes that arise as an energetic consequence of Ohmic heating are examined in relation to the dynamic magnetic-tearing instability. Plasma compression is found to give rise to a set of unstable thermal modes not seen in previous incompressible studies. Such modes can occur in parameter regimes where no purely growing tearing mode exists.

38363 **Symmetry properties of a multidimensional dispersion functional.** Schwarzmeier, J.L.; Barnes, D.C.; Lewis, H.R.; Seyler, C.E. (Los Alamos National Laboratory, MS-F642, Los Alamos, New Mexico 87545). *Physics of Fluids;* **30**: No. 8, 2414-2428(Aug 1987).

Symmetry properties are presented for a multidimensional dispersion functional. If the system of linearized Vlasov-field equations is "completely Hamiltonian," the dispersion operator satisfies a certain formal self-adjointness property as a function of omega. For appropriate boundary conditions this implies a relation between an eigenfunction and its dual. If the equilibrium admits "conjugate orbits" for a completely Hamiltonian system and if the "conjugate-orbit parity condition" is satisfied, then the kinetic part of the dispersion matrix is symmetric. For this case and for appropriate boundary conditions the entire dispersion matrix for the multispecies Vlasov or Vlasov-fluid models is symmetric. It then follows that the complex conjugate of the dual eigenfunction is proportional to the eigenfunction itself. The analytic continuation of the dispersion functional of the linearized Vlasov-field equations into the lower half of the frequency plane is derived.

38364 **Electron heating by ion acoustic turbulence in simulated low Mach number shocks.** Tokar, R.L.; Gary, S.P.; Quest, K.B. (Inertial Fusion and Plasma Theory, X-1, Applied Theoretical Physics Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physics of Fluids;* **30**: No. 8, 2569-2575(Aug 1987).

Explicit and fully electromagnetic particle-in-cell simulations of perpendicular, collisionless, and nominally subcritical shocks are performed in one and two spatial dimensions using the code w-smcapsa-smcapsVe-smcaps [Phys. Fluids 14, 830 (1971)]. Shock parameters are chosen to maximize the growth rates of the current driven ion acoustic instability in the shock. Electron heating by ion acoustic turbulence is observed at the shocks, at rates in agreement with second-order Vlasov theory predictions. However, the amount of resistive electron heating is small and ion reflection provides the major source of dissipation. Strictly resistive shocks do not exist for the parameters suitable for explicit particle codes running on today's supercomputers, because the plasma convects through these shocks so quickly that current driven instabilities have little time to be amplified and to heat the electrons resistively. This effect is primarily a result of the relatively small values of ω/sub p//sub e//ω/sub c//sub e/ that can be analyzed.

38365 **Observation of steepening in electron plasma waves driven by stimulated Raman backscattering.** Umstadter, D.; Williams, R.; Clayton, C.; Joshi, C. (University of California, Los Angeles, California 90024). *Physical Review Letters;* **59**: No. 3, 292-295(20 Jul 1987).

Harmonics of plasma waves excited by $CO_2$-laser—induced stimulated Raman scattering have been observed by frequency- and wave-number-resolved ruby Thomson scattering. Measurements of their relative amplitudes agreed with predictions of nonlinear warm-plasma wave-steepening theory up to the maximum observed amplitude of the fundamental component, n-italic-tilde$_1$/$n_0$ = 16%.

38366 **NOVA: A nonvariational code for solving the MHD stability of axisymmetric toroidal plasmas.** Cheng, C.Z.; Chance, M.S. (Princeton Plasma Physics Laboratory, Princeton, New Jersey 08544). *Journal of Computational Physics;* **71**: No. 1, 124-146(Jul 1987). Contract AC02-76CH03073.

A nonvariational approach for determining the ideal MHD stability of axisymmetric toroidal confinement systems is presented. The code (NOVA) employs cubic B-spline finite elements and Fourier expansion in a general flux coordinate (psi,$\theta$,$\xi$) system. At least as much accuracy and faster convergence were obtained in comparison with the existing variational PEST and ERATO codes which employ linear finite elements. This nonvariational approach benchmarked here on the ideal MHD problem is a prelude to a future extended version applicable to problems having non-Hermitian eigenmode equations were variational energy principles cannot be obtained. Copyright 1987 Academic Press, Inc.

38367 **Method and apparatus for maintaining equilibrium in a helical axis stellarator.** Reiman, A.; Boozer, A. (to Dept. of Energy, Washington, DC). US Patent 4,668,464. 26 May 1987. Filed date 31 Oct 1984. vp.

A method is described of maintaining three-dimensional MHD equilibrium of a plasma contained in a helical axis stellarator. The stellarator has a set of primary coils. The method comprises: providing a current through a resonant coil system about the stellarator. The resonant coil system has a configuration such that the current therethrough generates a magnetic field cancelling the resonant magnetic field, B/sub 1/, produced by currents driven by the plasma pressure at any given flux surface resonating with the rotational transform, chi, of another flux surface in the plasma; and varying the current as a function of $\beta$, where $\beta$=2p/sub o//B/sub o/2, p/sub o/ is the average plasma pressure, and B/sub o/ is the average stellarator magnetic field produced by the primary coils.

38368 **(CONF-870292—1-Vugraphs) Review of the Advanced Toroidal Facility program.** Lyon, J.F.; Murakami, M. (Oak Ridge National Lab., TN (USA)). 25 Feb 1987. Contract AC05-84OR21400. 70p. NTIS, PC A04/MF A01; 1; GPO Dep. File Number DE87007926.

From Magnetic Fusion Advisory Committee meeting; Atlanta, GA, USA (24 Feb 1987).

This report summarizes the history and design goals of the Advanced Toroidal Facility (ATF). The ATF is nearing completion at ORNL with device completion expected in May 1987 and first useful plasma operation in June/July 1987. ATF is a moderate-aspect-ratio torsatron, the world's largest stellarator facility with R = 2.1 m, $\alpha$ bar = 0.3 m and B = 2 T (5-s pulse) or 1 T (steady-state capability). It has been specifically designed to support the US tokamak program by studying important toroidal confinement issues in a similar magnetic geometry that allows external control of the magnetic configuration properties and their radial profiles: transform, shear, well depth, shaping, axis topology, etc. ATF will operate in a current-free model which allows separation of current-driven and pressure-driven plasma behavior. It also complements the world stellarator program in its magnetic configuration (between Heliotron-E and W VII-AS) and its capabilities (large size, good access, steady state capability, second stability access, etc.). For both roles ATF will require high-power long-pulse heating to carry out its physics goals since the high power NBI pulse is limited to 0.3 s. The ATF program focuses on demonstrating the principles of high-beta, steady-state operation in toroidal geometry through its study of: (1) scaling of beta limits with magnetic configuration properties and the plasma behavior in the second stability regime; (2) transport scaling at low collisionality and the role/control of electric field; (3) control of plasma density and impurities using divertors; (4) plasma heating with NBI, ECH, ICH, and plasma fueling with gas puffing and pellet injection; and (5) optimization of the magnetic configuration.

38369 **(CONF-870405—4-Vugraphs) One and two dimensional radiation analysis of the compact ignition tokamak.** Selcow, E.C. (Oak Ridge National Lab., TN (USA)). 22 Apr 1987. Contract AC05-84OR21400. 17p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87009686.

From Radiation protection and shielding conference; Knoxville, TN, USA (22 Apr 1987).

This report consists of a group of slides describing the compact ignition tokamak (CIT). Several drawings present the layout of the facility. Concerns about radiation effects are mentioned. (JDH)

38370 **(CONF-870422—5) Tritons and tritides as the solute and diffusing species in ceramic tritium breeders.** Fischer, A.K.; Johnson, C.E. (Argonne National Lab., IL (USA)). 1987. Contract W-31109-ENG-38. 21p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011523.

From 89. annual meeting of the American Ceramic Society; Pittsburgh, PA, USA (26 Apr 1987).

Intragranular diffusion of tritium is an inherent participant in the process of releasing tritium from lithium-containing ceramics that are used to breed tritium in a fusion reactor. The nature of this transport is reviewed in terms of the understanding established for the mechanism of hydrogen migration in other oxides, namely, that the diffusing species is the proton and that it moves from oxide ion to oxide ion, thereby giving rise to apparent hydroxide migration. Analogously, the triton, transiently bonded to successive oxides and forming successive tritoxides, is taken to be the dominant migrating species in ceramic breeders. In addition, tritide becomes a significant participant at low oxygen activity. The relationship of tritons and tritides as the migrating species to the observed release of both reduced and oxidized forms can be understood in terms of the thermodynamic conditions that prevail. Mechanisms exist that can be proposed to rationalize the participation of these species.

38371 **(CONF-870570—12) Tests of a high-power folded waveguide coupler for ICRF heating.** Owens, T.L.; Chen, G.L.; Haste, G.R.; Ryan, P.M. (Oak Ridge National Lab., TN (USA)). 1987. Contract AC05-84OR21400. 5p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010390.

From 7. topical conference on applications of radio-frequency power to plasmas; Kissimmee, FL, USA (4 May 1987).

A full-scale folded waveguide coupler has been fabricated which will provide information on power handling, impedance matching, and multipactor effects. The coupler dimensions are 30 X 60 X 300 cm. The cross section of the coupler is small enough that a phased pair of couplers could be placed in a single Tore Supra or TFTR port. A single coupler could be placed in a CIT-size port. A movable back plate allows frequency adjustment over the range 78 to 140 MHz. Impedance matching at the waveguide has been achieved using a movable coaxial transmission line feed. bench-top comparisons with loop antennas have been made. The folded waveguide coupler will be mounted on the Radio Frequency Test Facility for high-power tests up to 1.5 MW.

38372 **(CONF-870629—1) Pellet injector research at ORNL.** Schuresko, D.D.; Milora, S.L.; Combs, S.K.; Foster, C.A.; Fisher, P.W.; Argo, B.E.; Barber, G.C.; Foust, C.R.; Gethers, F.E.; Gouge, M.J. (Oak Ridge National Lab., TN (USA)). 1987. Contract AC05-84OR21400. 4p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010402.

From 14. European conference on controlled fusion and plasma physics; Madrid, Spain (22 Jun 1987).

Several advanced plasma fueling systems are under development at the Oak Ridge National Laboratory (ORNL) for present and future magnetic confinement devices. These include multishot and repeating pneumatic pellet injectors, centrifuge accelerators, electrothermal guns, a Tritium Proof-of-Principle experiment, and an ultrahigh velocity mass ablation driven accelerator. A new eight-shot pneumatic injector capable of delivering 3.0 mm, 3.5 mm, and 4.0 mm diameter pellets at speeds up to 1500 m/s into a single discharge has been commissioned recently on the Tokamak Fusion Test reactor. The so-called Deuterium Pellet Injector (DPI) is a prototype of a Tritium Pellet Injector (TPI) scheduled for use on TFTR in 1990. Construction of the TPI will be preceded by a test of tritium pellet fabrication and acceleration using a 4 mm bore "pipe gun" apparatus. A new repeating pneumatic pellet injector capable of 2.7 mm, 4 mm, and 6 mm operation is being installed on the Joint European Torus to be used in ORNL/JET collaborative pellet injection studies. A 1.5 m centrifuge injector is being developed for application on the Tore Supra experiment in 1988. The new device, which is a 50% upgrade of the prototype centrifuge used on D-III, features a pellet feed mechanism capable of producing variable-size pellets (1.5 to 3.0 mm diameter) optimally shaped to survive acceleration stresses. Accelerating pellets to velocities in excess of 2 km/s is being pursued through two new development undertakings. A hydrogen plasma electrothermal gun is operational at 2 km/s with 10 mg hydrogen pellets; this facility has recently been equipped with a pulsed power supply capable of delivering 1.7 kJ millisecond pulses to low impedence arc loads.

38373 **(CONF-870629—2) ICRF [ion cyclotron range of frequencies] coupling on DIII-D and the implications on ICRF technology development.** Hoffman, D.J.; Baity, F.W.; Mayberry, M.J.; Swain, D.W. (Oak Ridge National Lab., TN (USA); GA Technologies, Inc., San Diego, CA (USA)). 1987. Contract AC05-84OR21400. 5p. NTIS, PC A02. File Number DE87010393.

From 14. European conference on controlled fusion and plasma physics; Madrid, Spain (22 Jun 1987).

Low-power coupling tests have been carried out with a prototype ion cyclotron range of frequencies (ICRF) compact loop antenna on the DIII-D tokamak. Plasma load resistance values higher than originally calculated are measured in ohmic and L-mode, beam-heated plasmas. Load resistance decreases by a factor of ~2 in H-mode operation. When edge localized modes (ELMs) occur, the antenna loading increases transiently to several ohms. Results indicate that fast-wave ICRF antenna coupling characteristics are highly sensitive to changes in the edge plasma profiles associated with the H-mode regime.

38374 **(CONF-870629—3) Technology development of antennas for ion cyclotron heating experiments in fusion devices.** Swain, D.W.; Baity, F.W.; Bryan, W.E.; Hoffman, D.J.; Owens, T.L.; Yugo, J.J. (Oak Ridge National Lab., TN (USA); McDonnell Aircraft Co., St. Louis, MO (USA); TRW Space and Technology Group, Redondo Beach, CA (USA)). 1987. Contract AC05-84OR21400. 5p. NTIS, PC A02. File Number DE87010373.

From 14. European conference on controlled fusion and plasma physics; Madrid, Spain (22 Jun 1987).

Antennas are being designed, fabricated, and tested for TFTR and Tore Supra that will deliver 4 MW per port to the hot plasma. The antennas' designs are nearly complete; they are backed by the results of extensive modeling, analyses, and tests of electrical, thermal, and structural characteristics that were carried out during the design process. Conceptual design for an antenna for the Compact Ignition Torus (CIT) is underway; it will require significantly higher rf power densities.

38375 **(CONF-8703140—1-Vugraphs) Ignition physics study group support of the engineering test reactor program.** Sheffield, J. (Oak Ridge National Lab., TN (USA)). 24 Mar 1987. Contract AC05-84OR21400. 10p. NTIS, PC A02. File Number DE87008790.

From Field task proposal agreement review meeting; Washington, DC, USA (24 Mar 1987).

This paper consists of a series of vugraphs concerning the Engineering Fast Reactor Program. Design goals for the reactor are discussed and presented graphically. (JDH)

38376 **(CONF-8705133—1-Vugraphs) The ignition physics study group supports the compact ignition tokamak and engineering test reactor programs.** Sheffield, J. (Oak Ridge National Lab., TN (USA)). 1987. Contract AC05-84OR21400. 16p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87009125.

From 1. meeting of the US-EC Fusion Bilateral Coordinating Committee; Brussels, Belgium (6 May 1987).

This report presents a collection of Vugraphs dealing with the Compact Ignition Tokamak (CIT) and the Engineering Test Reactor (ETR). The role of the Ignition Physics Study Group is defined. Several design goals are presented. (JDH)

38377 **(DOE/ER/52118—2) Compact reactor studies: Technical progress report, 1 December 1986 through 30 November 1987.** Steiner, D.; Embrechts, M.J. (Rensselaer Polytechnic Inst., Troy, NY (USA)). Jun 1987. Contract FG02-85ER52118. 21p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010960.

This status report describes activities in two task areas: the Titan Reversed-field-Pinch Reactor (RFPR) study and Engineering Test Reactor (ETR) studies. In the Titan study, an investigation has

been made of the integrated-blanket-coil concept. This paper describes the thermal hydraulics, wall loading, and divertor coil and fast wall design. The ETR studies have focused on breeding blanket/breeding shield design options. A description of water chemistry and corrosion effects is provided. Uncertainties in the calculational model for the dose and dose limit in the polyimide insulator are also expressed. (FI)

**38378 (EGG—2508) Fusion Safety Program annual report: Fiscal year 1986.** Holland, D.F.; Merrill, B.J.; Herring, J.S.; Piet, S.J.; Longhurst, G.R. (EG and G Idaho, Inc., Idaho Falls (USA)). Jun 1987. Contract AC07-76ID01570. 44p. NTIS, PC A03/MF A01; GPO Dep. File Number DE87010942.

This report summarizes the Fusion Safety Program's (FSP) major activities in fiscal year 1986. The Idaho National Engineering Laboratory (INEL) is the designated lead laboratory, and EG & G Idaho, Inc., is the prime contractor for FSP, which was initiated in 1979. Activities are conducted at the INEL and in participating facilities, including the Hanford Engineering Development Laboratory (HEDL), the Massachusetts Institute of Technology (MIT), and the University of Wisconsin. The technical areas covered in this report include tritium safety, activation product release, reactions involving lithium breeding materials, safety of fusion magnet systems, plasma disruption, risk assessment methodology, and computer code development for reactor transients. Contributions to the Technical Planning Activity (TPA) and the "white paper" study by the Environmental, Safety,and Economics Committee (ESECOM) are summarized. The report also includes a summary of the safety and environmental analysis and documentation performed by the INEL for the Compact Ignition Tokamak (CIT) design project.

**38379 (ENEA-RT-FUS—86-7) Contributions to the 14th symposium on fusion technology.** Andreani, R. (ENEA, Rome (Italy)). Feb 1987. 102p. (CONF-860917—). NTIS (US Sales Only), PC A06. File Number DE87752631.

From 14. SOFT - symposium on fusion technology; Avignon, France (8 Sep 1986).

The FTU (Frascati Tokamak Upgrade) aims to achieve high values of nt and temperature. High densities and confinement times should be reached by the use of high magnetic fields (8T) and reduced size and a strong lower hybrid additional heating (8 MW at 8 GHz) will be applied to raise plasma temperature. The main features of the machine are: liquid nitrogen cooling, to reduce power and energy consumption, flexibility in plasma current and position control, all stainless steel vacum chamber, liner and limiter stuctures. The machine is presently in an advanced construction stage. The new 250 MVA flywheel generator and few component parts are already in Frascati in the new buildings and the project team is pushing to keep the envisaged timing that should see the first operation of the machine at room temperature at the end of 1987.

**38380 (GA-A—18842) Enhanced particle flux control in a tokamak with a resonant helical divertor.** Evans, T.E.; deGrassie, J.S.; Jackson, G.L.; Ohyabu, N.; Karger, F.; Haas, G.; Wootton, A.J.; Gentle, K.W.; McCool, S.M.; Rowan, W.L. (GA Technologies, Inc., San Diego, CA (USA)). May 1987. Contract AC05-78ET53043;AC03-84ER53158. 12p. (CONF-870629—4). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010651.

From 14. European conference on controlled fusion and plasma physics; Madrid, Spain (22 Jun 1987).

A series of experiments designed to demonstrate the efficacy of the Resonant Helical Divertor (RHD) concept in a tokamak have been completed. These proof-of-principle experiments utilized a small scoop limiter and a simple modular coil set to produce an m = 7, n = 2 RHD configuration for controlling the particle efflux and edge refueling rate in the Texas Experimental Tokamak (TEXT). The coils were designed to generate a quasi-ergodic edge layer using a few modes. Nevertheless at small perturbation levels intact islands are produced. The results clearly demonstrate greater flux control than had been expected for this simple RHD geometry. Conditions necessary for optimal particle collection are the scoop limiter at the o-point of a 7/2 magnetic island, a 4 kA current in the coils producing islands of ~1.0 cm full width, and helium discharges at high toroidal magnetic field (B/sub t/ = 2.8T). The neutral density within the scoop limiter head is increased by up to 500% and recycling on the front scoop face can be reduced as much as 80%. Under optimal collection conditions the central electron density is reduced by 20% indicating enhanced globall particle control. Experimental results and implications of cross-field particle diffusion are presented. A comparison of RHD efficiencies in hydrogen and helium discharges is discussed.

**38381 (KFK—4165) Nuclear fusion project. Semi-annual report of the Association KfK/EURATOM. April 1986-September 1986.** (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Kernfusion). Nov 1986. 80p. (EUR—10534e). NTIS, PC E09; Available from NTIS as TIB/B87-07049.

Nuclear fusion is one of the main activities of the Karlsruhe Nuclear Research Center (KfK). It is organized as a project under the Directorate of Reactor Development and Safety. The work of KfK concentrates on technology aspects of nuclear fusion with magnetic confinement. It is part of the European Fusion Programme where KfK participates as an association to EURATOM. Close links have been established to the Max Planck Institute for Plasma Physics (IPP). In the Entwicklungsgemeinschaft Kernfusion KfK and IPP cooperate for the development of future fusion experiments joining the experience gained in plasma physics (IPP) and materials, safety, and nuclear technology (KfK), respectively. As in the present strategy of the European Fusion Programme the Next European Tokamak (NET) is foreseen as the major next step, most of the activities of KfK address this subject. In addition to the contributions to NET, studies are carried out to innovate INTOR, the worldwide cooperation for an experimental reactor under the auspices of IAEA. Furthermore, the Entwicklungsgemeinschaft Kernfusion has evaluated the feasibility of a fusion reactor with a stellarator confinement.

**38382 (PPPL—2421) Impurity and particle transport and control in TFTR.** Hill, K.W.; Arunasalam, V.; Bell, M.G.; Bitter, M.; Blanchard, W.R.; Bretz, N.L.; Budny, R.; Bush, C.E.; Cohen, S.A.; Combs, S.K. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Apr 1987. Contract AC02-76CH03073. 19p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010631.

Degassing of the TFTR graphite limiter by low density deuterium or helium discharges enables the limiter to pump deuterium, thereby reducing recycling and improving energy confinement in neutral-beam-heated discharges. During a helium degassing sequence the hydrogen influx decreased by a factor of 20. As a consequence of degassing sequences the low density limit in 0.8 mA deuterium discharges decreased from 1 x $10^{19}$ $m^{-3}$ to 0.5 x $10^{19}$ $m^{-3}$, the density-decay time dropped from greater than 10 s to 0.15 s, and the recycling coefficient dropped from nearly 1 to less than 0.4. Z/sub eff/ values in 2.2 MA L-mode discharges on the toroidal limiter with neutral-beam-heating power up to 15 MW are between 2 and 3 if the pre-beam plasma has low Z/sub eff/ (high density), but can be as high as 4.5 if the pre-beam target has high Z/sub eff/ (low density). Z/sub eff/ values in enhanced confinement shots drop from 7 during the ohmic phase to 3 with neutral beam heating. The radiated power drops from 60 to 70% of total heating power to 30 to 35% for beam powers from 10 to 20 MW.

**38383 (UCRL—92353) Important atomic physics issues for ion beam fusion.** Bangerter, R.O. (Lawrence Livermore National Lab., CA (USA)). 19 Mar 1985. Contract W-7405-ENG-48. 9p. (CONF-8509397—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87008755.

From 2. international workshop on atomic physics for ion fusion; Appleton, UK (11 Sep 1985).

This paper suggests several current atomic physics questions important to ion beam fusion. Among the topics discussed are beam transport, beam-target interaction, and reactor design. The major part of the report is discussion concerning areas of research necessary to better understand beam-target interactions. (JDH)

38384 **(UCRL—93569-Rev.1) Near spherical illumination of ion-beam and laser targets.** Mark, J.W.K. (Lawrence Livermore National Lab., CA (USA)). 12 Dec 1985. Contract W-7405-ENG-48. 18p. (CONF-8611161—1-Rev.1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87008483.

From American Physical Society meeting; San Diego, CA, USA (4 Nov 1986).

A procedure is developed for reducing energy-deposition asymmetry in spherical targets driven directly by ion or laser beams. This work is part of a strategy for achieving illumination symmetry in such targets, which is proposed as an alternative to those in the literature. This strategy allows an axially symmetric placement of beamlets, which would be convenient for some driven or reactor scenarios. It also allows the use of beam currents or energy fluxes and beam transverse profiles to help reduce deposition asymmetry with fewer beamlets. In the ideal limit of thin deposition layers and controlled beam profiles, at most six beamlets are needed for target symmetry.

38385 **(UCRL—94346-Rev.1) Symmetry issues in a class of ion beam targets using sufficiently short direct drive pulses.** Mark, J.W.K.; Lindl, J.D. (Lawrence Livermore National Lab., CA (USA)). 23 Oct 1986. Contract W-7405-ENG-48. 10p. (CONF-8610285—1-Rev.1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87009607.

From Heavy ion fusion symposium; Washington, DC, USA (1 Oct 1986).

Controlling asymmetries in direct drive ion beam targets depends upon the ability to control the effects of residual target asymmetries after an appropriate illumination scheme has already been utilized. A class of modified ion beam targets where residual asymmetries are ameliorated is considered. The illumination scheme used is an axially symmetric one convenient for reactor designs. Residual asymmetries are controlled by limiting the radial motion of the radius R/sub dep/ of peak ion energy deposition. Limiting the motion of R/sub dep/ is achieved by lengthening the time scale t/sub s/ where changes in R/sub dep/ adversely affect asymmetries. In our example, t/sub s/ becomes longer than the duration $\Delta$t/sub D/ of the entire direct drive pulse train (t/sub s/ > $\Delta$t/sub D/).

38386 **Pellet injection on the ZT-40M reversed field pinch.** Watt, R.G.; Wurden, G.A.; Weber, P.G.; Buechl, K.; Spanos, E.K. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Review of Scientific Instruments;* **58**: No. 8, 1401-1405(Aug 1987). Contract W-7405-ENG-36.

The four barrel pneumatic pellet injector originally used on the Alcator C tokamak at MIT has been reconfigured for use on the ZT-40M reversed field pinch (RFP) at Los Alamos National Laboratory. The lower temperature and density in this device require operation at velocities significantly lower than on Alcator. Allowing a 2-s warmup prior to firing the injector has enabled operation with pressures as low as 40 psig and velocities ranging as low as 200 m/s with $H_2$ pellets, without major cryostat modification. Initial injection experiments in the ZT-40M plasma have verified that pellet refueling is effective for density control, but the net particle inventory increase is less than might be expected based on simple models. Indications of nonoptimal penetration and curvature of the pellet trajectory, in addition to comparable time scales for particle confinement and pellet transit, may account for this.

38387 **On relativistic self focusing.** Lee, P.H.Y. (Los Alamos National Lab., NM, USA). *Laser and Particle Beams;* **5**: 15-25(Feb 1987).

Ponderomotive force initiated laser self focusing can be enhanced by relativistic electron motion in a laser plasma. The nonlinear refractive index due to relativistic effects is derived and it is found that relativistic self focusing becomes important for a 0.25 $\mu$m laser when the laser intensity exceeds $5 \times 10^{18}$ W/cm$^2$.

38388 **The migration and coalescence of tritium-induced helium bubbles during creep in nickel.** Mintz, J.M.; Sattler, M.L.; Mukherjee, A.K. (Sandia National Labs., Livermore, CA 94550). *Scripta Metallurgica;* **21**: No. 2, 191-196(Feb 1987).

Understanding the behavior of helium in fusion reactor materials continues to be of critical importance to reactor designers. Of particular concern is the deleterious effect of grain boundary helium bubbles on mechanical properties, especially the high temperature ductility, of stainless steels. Grain boundary helium bubbles larger than a "critical" size for vacancy absorption are believed to reduce ductility by acting as ready-made nuclei for creep cavities. Rapid growth of these cavities then leads to premature intergranular fracture. Freshly nucleated bubbles are typically, however, only a few nanometers in size and are too small for growth by vacancy absorption. The subcritical growth regime implied by these observations was the subject of the present investigation. High purity nickel, as a less complex "analog" of stainless steel, was chosen as the material. Grain boundary helium bubbles act as effective creep cavity nuclei after attaining critical size for growth by vacancy absorption.

38389 **Radiographic detection of 100 a thickness variations in 1-$\mu$m-thick coatings on submillimeter-diameter laser fusion targets.** Stupin, D.M. (Los Alamos National Lab., NM). pp 1485-1494 of Review of progress in quantitative nondestructive evaluation. Volume 6B. Thompson, D.O.; Chimenti, D.E. (eds.). New York, NY; Plenum Press (1987). (CONF-8608142—).

From Review of progress in quantitative NDE; La Jolla, CA, USA (3 Aug 1986).

The author has developed x-ray radiography to measure thickness variations of coatings on laser fusion targets. Their technique is based on measuring the variation in x-ray transmission through the targets. The simplest targets are hollow glass microshells or microballoons 100 to 500 $\mu$m in diameter that have several layers of metals or plastics 1 to 100 $\mu$m thick. Their goal is to examine these opaque coatings for thickness variations as small as 1% or 0.1%, depending on the type of defect. Using contact radiography they have obtained the desired sensitivity for concentric and elliptical defects of 1%. This percentage corresponds to thickness variations as small as 100 A in a 1-$\mu$m-thick coating. For warts and dimples, the desired sensitivity is a function of the area of the defect, and they are developing a system to detect 0.1% thickness variations that cover an area 10 $\mu$m by 10 $\mu$m.

38390 **Progress in light ion beam fusion research on PBFA II.** Cook, D.L.; Allshouse, G.O.; Bailey, J. (Sandia National Labs., Albuquerque, NM, USA). *Plasma Physics and Controlled Fusion;* **28**: No. 12B, 1921-1930(Dec 1986). (CONF-8606323—).

From 13. annual conference Plasma Physics Group of the Institute of Physics; Oxford, UK (26 Jun 1986).

PBFA II is a 100 TW pulsed power accelerator constructed at Sandia National Laboratories for use in the Light Ion Fusion Program. The objective of PBFA II is to accelerate and focus upon an inertial confinement fusion (ICF) target a lithium beam with sufficient energy, power, and power density to perform ignition scaling experiments. The technologies used in PBFA II include: (1) primary energy storage and compression with 6 MV, low-inductance Marx generators, (2) pulse forming in water-insulated, water-dielectric lines with self-closing water switches, (4) voltage addition in vacuum using self-magnetically-insulated biconic transmission lines, (5) inductive energy storage and pulse compression using a fast-opening plasma erosion switch, (6) beam formation using a magnetically-insulated ion diode, and (7) space-charge and current-neutralized beam propagation to the target in a gas-filled cell. The first multimodule shot was on December 11, 1985. The plans for PBFA II include development and demonstration of the pulse-shaping techniques which are necessary for high-gain target compressions. Following a modification of the accelerator which will probably include an "extraction" ion diode, a 4- to 5-meter plasma channel for beam bunching during propagation, and a target chamber located beneath the accelerator, temporally-shaped ion beam pulses will be available for pulse-shaped target experiments.

# 99 GENERAL AND MISCELLANEOUS

**38391 (DOE/CE/63492—T3) Energy related business development project: Final report.** (Maine Development Foundation, Augusta (USA)). 31 Mar 1987. Contract FG01-86CE63492. 258p. NTIS, PC A12/MF A01; 1; GPO Dep. File Number DE87012139.

This report describes the conclusions of the team of consultants engaged by the Kennebec Valley Community Action Program (KVCAP) to develop a business plan for a for-profit energy related business to be partially owned by interested Maine CAPs. The consulting team conducted a reconnaissance study of twelve alternative business concepts and subsequently recommended focusing on a residential remodeling and repair business that incorporated major elements of two of the twelve concepts studied. The remodeling/repair business was subjected to a thorough analysis which included a 600 respondent consumer market survey and three focus group market studies, an evaluation of successful operators in the business, and an analysis of future trends in the industry. The consulting team developed a business plan, or more accurately two integrated business plans, for a business that has a significant amount of risk.

**38392 (DOE/CE/63498—T1) Code name: Opportunity battery: Phases 1 and 2 of Department of Energy Business Plan.** Sniff, B. (Community Action Commission of Fayette County, Washington Court House, OH (USA)). 15 May 1986. Contract FG01-86CE63498. 44p. NTIS, PC A03. File Number DE87010785.

The following are part of this report: business plan for Tri-County heating, personnel policies for Tri-County heating, and preliminary business plan for Operation Battery, a battery reconditioning and recycling project. (DLC)

**38393 (DOE/ER—0146/2) Office of Basic Energy Sciences: 1986 summary report.** (USDOE Office of Energy Research, Washington, DC. Office of Basic Energy Sciences). Dec 1986. 45p. NTIS, PC A03/MF A01; 1; GPO Dep. File Number DE87005570.

This document describes the program of the DOE Office of Basic Energy Sciences, which is responsible for basic research in the scientific disciplines likely to contribute to long-term energy goals. The subprograms and facilities are discussed, along with an abbreviated budget summary and an outline of plans for the future. (DLC)

**38394 (DOE/MA—0271) Doing business with the Department of Energy.** (USDOE Assistant Secretary for Management and Administration, Washington, DC. Office of Small and Disadvantaged Business Utilization). Apr 1987. 100p. H; 1; GPO Dep. File Number DE87012203.

Since our inception in October, 1977, we have often been asked how a small private concern goes about doing business with DOE. This guide is intended to answer that question by providing basic information and initial contacts for possible business opportunities.

**38395 (IFUSP-P—524) Spontaneous ideas about the speed of light.** Villani, A.; Pacca, J.L.A. (Sao Paulo Univ. (Brazil). Inst. de Fisica). Mar 1985. 14p. NTIS (US Sales Only), PC A02. File Number DE87900800.

The answers of a group of Physics graduate students to two problems on the speed of light are analyzed. The results seem to confirm the use of spontaneous ideas which are very similar to those which form the "spontaneous" kinematics proposed by E. Saltiel of the University of Paris VII. Some consequences related to the teaching of Physics and Special Relativity are discussed.

**38396 (LA-UR—87-2107) Vehicle tracking systems.** Schwalm, R.W. (Los Alamos National Lab., NM (USA)). 1987. Contract W-7405-ENG-36. 5p. (CONF-870890—3). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011755.

From 3. annual Armed Forces Communications Electronics Association and exposition; Philadelphia, PA, USA (4 Aug 1987).

Several systems have been developed to accomplish vehicle location. The systems consist of three types: Dead Reckoning, Satellite, and LORAN C. If the information is to be sent back to a central location, some type of radiocommunication system is needed. One can use the existing voice radio or add a radio system just for transmitting the data.

**38397 (NP—7900834) National Register of research projects: Part 1, Natural sciences: Biological, medical and related sciences.** (Department of National Education, Pretoria (South Africa)). Jul 1986. 260p. (In Afrikaans and English). NTIS (US Sales Only), PC A12. File Number DE87900834.

This Register is intended to serve as a source of information on research which is being conducted in all fields (both natural and human sciences) in the Republic of South Africa. New and current research projects that were commenced or continued during 1985, on which information was received by the compilers until March 1986, are included, with the exception of confidential projects.

**38398 (SAND—87-0002C) Authentication codes that permit arbitration.** Simmons, G.J. (Sandia National Labs., Albuquerque, NM (USA)). 1987. Contract AC04-76DP00789. 17p. (CONF-870255—2). NTIS, PC A02/MF A01; GPO Dep. File Number DE87011860.

From 18. southeastern international conference on combinatorics: graph theory computing; Boca Raton, FL, USA (23 Feb 1987).

Objective of authentication is to detect attempted deceptions in a communications channel. Traditionally this has been restricted to providing the authorized receiver with a capability of detecting unauthentic messages. The known codes have all left open the possibility for either the transmitter to disavow a message that he actually sent to the receiver, i.e., an authentic message, or else for the receiver to falsely attribute a message of his own devising to the transmitter. Of course the party being deceived would know that he was the victim of a deception by the other, but would be unable to "prove" this to a third party. Ideally, authentication should provide a means to detect attempted deceptions by insiders (the transmitter or receiver) as well as outsiders (the opponent). It has been an open question of whether it was possible to devise authentication codes that would permit a third party, an arbiter, to decide (in probability) whether the transmitter or the receiver was cheating in the event of a dispute. We answer this question in that both permits the receiver to detect outsider deceptions, as well affirmative by first constructing an example of an authentication code as permitting a designated arbiter to detect insider deceptions and then by generalizing this construction to an infinite class of such codes.

**38399 (SAND—87-0800C) A natural taxonomy for digital information authentication schemes.** Simmons, G.J. (Sandia National Labs., Albuquerque, NM (USA)). 1987. Contract AC04-76DP00789. 17p. (CONF-870833—2). NTIS, PC A02/MF A01; GPO Dep. File Number DE87011861.

From Crypto '87; Santa Barbara, CA, USA (16 Aug 1987).

Purpose of the lengthy description of the various authentication problems and schemes given here was two-fold: first to persuade the reader that each of the three essential dichotomies is genuine and arises in real-world situations and secondly, by construction of solutions to show that these really are independent classifications of authentication schemes. A figure summarizes the resulting classification and provides one or more examples of schemes illustrating each basic class.

**38400 (UCID—21106) A study of Economy of Force: An analysis of varying the size of a main and secondary taskforce against a dynamic defense.** Mohney, E.V.; Wittlin, M.R. (Lawrence Livermore National Lab., CA (USA)). 30 Jun 1987. Contract W-7405-ENG-48. 25p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87012309.

Computer simulation of combat is used to compare outcomes of blue attacks which varied in the number of forces taken from the main taskforce and sent to taskforce two. Taskforce one's mission is modeled as a frontal assault on a static red defense. Taskforce two's mission is modeled as a blocking force against a red reinforcement. The comparisons indicate an advantage to using the minimum

number of forces for taskforce two's mission. This suggests the importance of using the principle of war, Economy of Force, when planning an attack with more than one mission.

**38401 (AD-A—179071/6/XAB) Performance comparison of four state-of-the-art computer architectures. Master's thesis.** Lee, R.W. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). Dec 1986. 220p. (AFIT/GCS/ENG—86D-17). NTIS, PC A10/MF A01.

This study determined the relative performance trends of sequential, vector, and multiprocessor architectures solving computationally intense problems. The problem time complexity of sequential matrix multiplication and inversion algorithms on a Cyber 845, a Vax-11/785, and a Cray X-MP/12 were compared with parallelizations of the algorithms on an Intel Personal Supercomputer (iPSC). In addition, sequential and parallel sort algorithms were run on the Vax and iPSC, respectively. The implementations were run with a range of data sizes. The relative time complexities were determined by computing the factor of execution time increase in relation to the factor of data size increase. By analyzing the problem time complexity, the machine-specific influences on execution speed were partially accounted for, thus enabling generalizations to the corresponding architectural classes to be drawn. It was shown that the multiprocessor was the only architecture to allow a reduction in the problem time complexity, and speedups from vector operations were constant.

**38402 (AD-A—179303/3/XAB) Coherent VLSI environment. Semiannual technical report, 1 October 1986-31 March 1987.** Penfield, P.; Dally, W.J.; Glasser, L.A.; Knight, T.F.; Leighton, F.T. (Massachusetts Inst. of Tech., Cambridge (USA). Microsystems Research Center). 31 Mar 1987. 84p. NTIS, PC A05/MF A01.

It is important to know how fast a rise time can be achieved, or at what frequencies unwanted oscillations might occur. A set of necessary and sufficient bounds are now possible, in the sense that every point in the s-plane can be easily discovered to be either a frequency at which oscillation cannot occur with any possible combination of components and ideal transformers, or else a point at which a circuit consisting of a few such components and ideal transformers can be made to oscillate. The inclusion of ideal transformers is necessary since otherwise generally only a finite or countable number of natural frequencies can be found. Many new results have been derived for parallel algorithms and complexity, such as a hypercube with a large number of faulty nodes can be used, with high probability, as another perfectly functioning hypercube of half the size, by using reconfiguration algorithms that are simple, fast, and require only local information. The design of a message-driven processor continues. It is now being realized that many different highly parallel architectures require roughly the same sort of processing node, one that can respond quickly (i.e., with low latency) to messages that may require execution of a few (say about ten) instructions. The processor being designed can be considered an experiment in unifying message passing and shared-memory architectures.

**38403 (AD-A—179384/3/XAB) Performance evaluation of parallel branch and bound search with the Intel IPSC (Intel Personal Supercomputer) hypercube computer. Master's thesis.** Mraz, R.T. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). Dec 1986. 202p. (AFIT/GCE/ENG—86D-2). NTIS, PC A10/MF A01.

With the recent availability of commercial parallel computers, researchers are examining new classes of problems for benefits from parallel processing. This report presents results of an investigation of the set of problems classified as search-intensive. The specific problems discussed in this report are the backtracking search method of the N-queens problem and the Least-Cost Branch and Bound search of deadline job scheduling. The object-oriented design methodology was used to map the problem into a parallel solution. While the initial design was good for a prototype, the best performance resulted from fine tuning the algorithms for a specific computer. The experiments of the N-queens and deadline job scheduling included an analysis of the computation time to first solution, the computation time to all solutions, the speedup over a VAX 11/785, and the load balance of the problem when using an Intel Personal SuperComputer(IPSC). The IPSC is a loosely couple multiprocessor system based on a hypercube architecture. Results are presented that compare the performance of the IPSC and VAX 11/785 for these classes of problems.

**38404 (AD-A—179407/2/XAB) Experiment in knowledge-based signal understanding using parallel architectures. Technical report.** Brown, H.D.; Schoen, E.; Delagi, B.A. (Stanford Univ., CA (USA). Dept. of Computer Science). Oct 1986. 42p. (STAN-CS—86-1136). NTIS, PC A03/MF A01.

This report documents an experiment investigating the potential of a parallel-computing architecture to enhance the performance of a knowledge-based signal-understanding system. The experiment consisted of implementing and evaluating an application encoded in a parallel programming extension of Lisp and executing on a simulated multiprocessor system. The chosen application for the experiment was a knowledge-based system for interpreting preprocessed, passively acquired radar emissions from aircraft. The application was implemented in an experimental concurrent, asynchronous object-oriented framework. This framework, in turn, relied on the services provided by the underlying hardware system. The hardware system for the experiment was a simulation of various-sized grids of processors with interprocessor communication via message passing. The experiment investigated the effects of various high-level control strategies on the quality of the problem solution, the speedup of the overall system performance as a function of the number of processors in the grid, and some of the issues in implementing and debugging a knowledge-based system on a message-passing multiprocessor system. This report describes the software and (simulated) hardware components of the experiment and present the qualitative and quantitative experimental results.

**38405 (AD-A—179474/2/XAB) Optimal partitioning and redundancy removal in computing partial sums. Technical report (Final) December 1985-January 1987.** Fam, A.T. (State Univ. of New York, Buffalo (USA)). Mar 1987. 29p. NTIS, PC A03/MF A01.

Two novel algorithms for simultaneous computation of a large number of partial sums are introduced, their performance assessed, and architectures for their implementation suggested. The direct computation of D operations are replaced by O(D/ log D). The new approach is based on a new concept of optimal partitioning and redundancy removal in arithmetic-intensive, high-throughput computing that is expected to be the basis of a new class of algorithms, which represent a departure from brute force parallel computation where inherent redundancy is not detected or removed.

**38406 (AD-A—179577/2/XAB) Virtual communications to ASD's (Aeronautical Systems Division's) Cray computer via AFIT data communications resources. Master's thesis.** Tasseff, T.W. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). Dec 1986. 119p. (AFIT/GCS/ENG—86D-10). NTIS, PC A06/MF A01.

The AFIT-ASD Cray System, a virtual communications capability from the AFIT School of Engineering to ASD's Cray computer, was studied, created, and evaluated. The SADT design, detailed design, and System program code are included in the study. A user enters the System's user command SENDCRAY which initiated the user's input file to the central AFIT host computer. The input file is then sent first to the Cyber, which is a front-end to the Cray, and then to the Cray itself where the input is processed. Output from the Cray is sent to the Cyber and then back to the AFIT central computer. Finally, the output, with an accompanying job log file, is transferred to the user at the originating AFIT host computer. The System uses a combination of 4.2 BSD UNIX, Cyber NOS, and Cray operating system commands, and

makes use of an AFIT Ethernet network and a VAX-UNIX/Cyber HASP/modem link. The System operates over a series of UNIX C-shell programs, most of which are executed automatically. The System provides the user with simple, error-free, and automatic access to the Cray, with the potential of improved turnaround time for compute-intensive jobs at AFIT.

38407 **(BNL—39876) An assessment of the graphics upgrade needs of technology policy: Office of Policy, Planning and Analysis.** Kydes, A.S. (Brookhaven National Lab., Upton, NY (USA)). May 1987. Contract AC02-76CH00016. 14p. NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87011300.

This paper provides a review and assessment of the software and hardware upgrade needs of Technology Policy in the Office of Policy, Planning and Analysis (PE) of equipment previously provided to PE in support of ongoing model refinements/upgrades of the World Energy Models.

38408 **(FNAL-TM—1457) VMS software for the Jorway-411 interface.** Dorries, T.; Moore, C.; Pordes, R.; White, V. (Fermi National Accelerator Lab., Batavia, IL (USA)). May 1987. Contract AC02-76CH03000. 4p. (CONF-870552—17). NTIS, PC A02. File Number DE87011001.

From 5. conference on real-time computer applications in nuclear, particle, and plasma physics; San Francisco, CA, USA (11 May 1987).

This report describes a Software Package used to access CAMAC through the Jorway-411 Interface, for use on VAX/VMS systems. The software can be used to access parallel and/or serial CAMAC branch highways, and multiple Jorways may be connected to the VAX UNIBUS or MicroVax QBUS. The software available includes a VAX/VMS device driver for the JORWAY-411 and support routines and programs that access the driver. The software is accompanied by extensive documentation.

38409 **(FNAL-TM—1458) List processing software for the LeCroy 1821 Segment Manager Interface.** Dorries, T.; Moore, C.; Pordes, R. (Fermi National Accelerator Lab., Batavia, IL (USA)). May 1987. Contract AC02-76CH03000. 4p. (CONF-870552—18). NTIS, PC A02. File Number DE87011000.

From 5. conference on real-time computer applications in nuclear, particle, and plasma physics; San Francisco, CA, USA (11 May 1987).

Many experiments at Fermilab now include some FASTBUS electronics in their data readout. The software reported in this paper provides general support for the LeCroy 1821 interface. The list processing device drivers allow FASTBUS data to be read out efficiently into the Fermilab Computing Department supported data acquisition systems.

38410 **(FNAL-TM—1463) A multiple node software development environment.** Heinicke, P.; Nicinski, T.; Constanta-Fanourakis, P.; Petravick, D.; Pordes, R.; Ritchie, D.; White, V. (Fermi National Accelerator Lab., Batavia, IL (USA)). Jun 1987. Contract AC02-76CH03000. 7p. (CONF-870552—15). NTIS, PC A02. File Number DE87010995.

From 5. conference on real-time computer applications in nuclear, particle, and plasma physics; San Francisco, CA, USA (11 May 1987).

Experimenters on over 30 DECnet nodes at Fermilab use software developed, distributed, and maintained by the Data Acquisition Software Group. A general methodology and set of tools have been developed to distribute, use and manage the software on different sites. The methodology and tools are of interest to any group developing and using software on multiple nodes.

38411 **(LBL—23259) Interactive software for simulation of high resolution TEM images.** Kilaas, R. (Lawrence Berkeley Lab., CA (USA)). Apr 1987. Contract AC03-76SF00098. 29p. (CONF-870725—8). NTIS, PC A03. File Number DE87011090.

From 22. annual meeting of the Microbeam Analysis Society; Kailua-Kona, HI, USA (13 Jul 1987).

A new highly interactive and user friendly software package for simulation and processing of high resolution transmission electron micrographs has been developed at the National Center for Electron Microscopy (NCEM) at the Lawrence Berkeley Laboratory. Designed to be used by scientific visitors to the Center, the software is completely menu driven from a graphics terminal with a mouse and requires little to no computer knowledge for proper usage. Although the software is written to ensure maximum performance using hardware available at the NCEM, hardware dependent code is kept in separate modules that are easily modified. The new software package combines an unparalleled ease of use with the latest theory in the field of simulation of high resolution transmission electron micrographs.

38412 **(SAND—87-1114C) Coupling boundary integral and finite element formulations for nonlinear halfspace problems.** Stern, M.; Taylor, L.M. (Texas Univ., Austin (USA); Sandia National Labs., Albuquerque, NM (USA)). 1987. Contract AC04-76DP00789. 11p. (CONF-8704141—1). NTIS, PC A02/MF A01; 1; GPO Dep. File Number DE87010735.

From IUTAM symposium on advanced boundary element methods; San Antonio, TX, USA (13 Apr 1987).

In finite element applications involving static or quasistatic nonlinear inelastic response in unbounded regions, there is the question of how to truncate the region to be modeled and how to select appropriate boundary conditions to be imposed on the remote boundary. Typically such problems are modeled by placing the exterior boundary "far enough away" so that the effect of fixing the boundary does not significantly alter the stress and deformation in areas of interest. There are two drawbacks to this approach. First, there is always some effect no matter how far away the boundary is placed, which makes it difficult for the analyst to judge precisely how much effect his choice of the location of the boundary is having on the solution. The second and perhaps more important drawback is that the boundary must be placed so far away from regions of interest that an unnecessarily large number of elements must be used, which increases the computational cost of the analysis. A promising alternative is to use an exterior boundary integral representation to calculate a "boundary stiffness" for the exterior region which can then be coupled to the finite element formulation in the interior region. This boundary stiffness scheme has been implemented in two explicit finite element codes which are widely used at Sandia for plane and axisymmetric quasistatic finite element analyses: JAC which uses a conjugate gradient method in the iterative solution of the finite element equations, and SANCHO which relies on dynamic relaxation. In this report the boundary integral application is applied to halfspace problems and its numerical implementation is described.

38413 **Implementing distributed AI systems using MACE.** Gasser, L.; Braganza, C.; Herman, N. (Distributed Artificial Intelligence Group, Computer Science Dept., Univ. of Southern California, Los Angeles, CA 90089-0782). pp 315-320 of Proceedings of the third conference on artificial intelligence applications. Piscataway, NJ; IEEE Service Center (1987). (CONF-870258—).

From 3. IEEE conference on artificial intelligence applications; Orlando, FL, USA (22 Feb 1987).

This paper describes the experimental DAI development system MACE (Multi-Agent Computing Environment) using the implementation of a distributed blackboard system as an example. MACE is an instrumented testbed for building DAI systems at different levels of granularity. MACE agents run in parallel, and communicate via messages. They have been facilities for knowledge representation (e.g., models of other agents) and reasoning. The MACE environment maps agents to processors, handles inter-agent communication, and provides a language for describing agents, tracing and instrumentation, a facility for remote demons, and a collection of system-agents which construct user-agents from descriptions, monitor execution, handle errors, and interface to a user. MACE is implemented on a 16-node INTEL SYM-1 large-memory hypercube and in a Lisp machine environment. We have used MACE to model lower-level parallelism (several distributed production rule systems) and to build higher-level distributed problem-solving architectures (distributed blackboard and contract-net schemes).

38414 **Experiments on alternatives to minimax.** Nau, D.; Purdom, P.; Tzeng, C. *International Journal of Parallel Programming;* **15**: No. 2, 163-183(Apr 1986).

In the field of Artificial Intelligence, traditional approaches to choosing moves in games involve the use of the minimax algorithm. However, recent research results indicate that minimaxing may not always be the best approach. In this paper they report some measurements on several model games with several different evaluation functions. These measurements show that there are some new algorithms that can make significantly better use of evaluation function values than the minimax algorithm does.

38415 **Monitor - The prelude to robotics.** Grisham, D.L.; Lambert, J. (Los Alamos National Lab., Los Alamos, NM 87545). pp 507-514 of Alternative energy sources VII. Veziroglu, T.N. New York, NY; Hemisphere Publishing (1985). (CONF-851201—).

From 7. Miami international conference on alternative energy sources; Miami Beach, FL, USA (9 Dec 1985).

Robots and teleoperator systems will play an important role in future energy systems regardless of the particular energy source. Present remote handling systems were developed for radioactive environments; however, future sources, such as fusion reactors, solar concentrators, and wind generators will also produce environments too hostile for practical "hands on" maintenance. Teleoperator systems developed at the Clinton P. Anderson Meson Physics Facility (LAMPF) are a logical prelude to performing remote operations with robots. The "Monitor" remote handling systems represent state-of-the-art mechanical hardware and operating techniques - the only elements missing are suitable computer and software interfaces.

38416 **(AD-A—179323/1/XAB) Trace-driven simulation study of dynamic load balancing. Technical report, 7 August 1984-6 August 1987.** Zhou, S. (California Univ., Berkeley (USA). Dept. of Computer Sciences). Jan 1987. 30p. NTIS, PC A03/MF A01.

A trace-driven simulation study of dynamic load balancing in homogeneous distributed systems supporting broadcasting is presented. Information is about about job CPU and I/O demands collected from a production system as input to a simulation model that includes a representative CPU scheduling policy and considers the message exchange and job-transfer costs explicity. Seven load-balanced algorithms are simulated and their performances compared. It was found that load balancing is capable of significantly reducing the mean and standard deviation of job response times, especially under heavy system load, and for jobs with high resource demands. The performances of all hosts, even those originally with light loads, are generally improved by load balancing. The reduction of the mean response time increases with the number of hosts, but levels off at around 30 hosts. Algorithms based on periodic or non-periodic load information exchange provide similar performance, and, among the periodic policies, the algorithms that use a distinguished agent to collect and distribute load information cut down the overhead and scale better.

38417 **(AD-A—179359/5/XAB) Effects of message loss on distributed termination. Technical report.** Koo, R.; Toueg, S. (Cornell Univ., Ithaca, NY (USA). Dept. of Computer Science). 21 Mar 1987. 18p. (CU-CSD—87-823). NTIS, PC A02/MF A01.

This document studies the problem of termination in distributed systems with faulty communication channels. It is shown that for asynchronous systems, protocols that guarantee knowledge gain via message transfers cannot be guaranteed to terminate even if we assume that only transient communication failures can occur, and want to achieve only a weak kind of termination. The same result holds for synchronous systems as well.

38418 **(BNL—39830) A guide to telecommunications at Brookhaven National Laboratory.** (Brookhaven National Lab., Upton, NY (USA)). Jun 1987. Contract AC02-76CH00016. 37p. NTIS, PC A03/MF A01; GPO Dep. File Number DE87011291.

The first chapter of this manual is an introduction for all readers. It describes the broad range and diversity of communications services offered at Brookhaven National Laboratory. Subsequent chapters deal with specific systems and services. These chapters contain descriptive and technical information and may be read selectively. Goals of this manual are to give personnel at Brookhaven an overview of available telecommunications resources and facilities and to describe the policies and procedures involved in fulfilling communications requirements.

# CORPORATE AUTHOR INDEX

In the Corporate Author Index, report literature is indexed using the name of the organization or institution responsible for issuing the report. Headings are provided for all report literature and for published literature for which a corporate approach is especially desirable, e.g., symposium and conference proceedings.

Each entry under a corporate heading gives the document title and the volume and abstract numbers. The document type, e.g., R for Report; country of publication, e.g., US; and language of the document, e.g., In German, are given in parentheses at the end of the entry. If no language statement appears, the language is English. Tables of document types and country of publication codes appear after the indexes.

DOE Energy Data Base: Corporate Author Entries (DOE/TIC-4585) is used in the standardization of corporate entries. DOE/TIC-4585 is available for purchase from the National Technical Information Service (NTIS), U. S. Department of Commerce, Springfield, Virginia 22161.

Development of an advanced gas-fired furnace for high-temperature heating of continuously cast thin-section steel products. Final report, January-December 1986, 12:36463 (R;US)
**Brigham Young Univ., Provo, UT (USA)**
Identification of gas-phase dimethyl sulfate and monomethyl hydrogen sulfate in the Los Angeles atmosphere, 12:37645 (R;US)
Thermodynamics of molecular interactions in coal liquids: Progress report for the period July-December 1986, 12:36260 (R;US)
**Brigham Young Univ., Provo, UT (USA). Dept. of Physics and Astronomy**
Enhancing the muon-catalyzed fusion yield, 12:38324 (R;US)
**British Coal, Stanhope Brethy. HQ Technical Dept.**
Development of free-steered vehicles, 12:36339 (R;GB)
**Brookhaven National Lab., Upton, NY (USA)**
A guide to telecommunications at Brookhaven National Laboratory, 12:38418 (R;US)
A safeguards risk approach to inspection scheduling, 12:36557 (R;US)
Accelerated Leach Test(s) Program: Annual report, 12:36500 (R;US)
An assessment of the graphics upgrade needs of technology policy: Office of Policy, Planning and Analysis, 12:38407 (R;US)
An environmental source book on the photovoltaics industry, 12:36958 (R;US)
An introduction to the physics and instrumentation of positron emission tomography, 12:37874 (R;US)
Analysis of the start-up and control of a particle bed reactor, 12:36779 (R;US)
Artificial magnetic superlattices, 12:38295 (R;US)
Effects of calmodulin inhibitors on the cellular metabolism of $^{45}Ca$ and $^{210}Pb$, 12:37937 (R;US)
Elastic scattering of muon neutrinos at BNL, 12:38115 (R;US)
Electroweak radiative corrections and neutral current phenomenology, 12:38112 (R;US)
Emergency response training with the BNL plant analyzer, 12:36811 (R;US)
Low-level waste source term evaluation: Review of published modeling and experimental work, and presentation of low-level waste source term modeling framework and preliminary model development: Topical report, 12:36521 (R;US)
Magnetism of MnSi and FeSi, 12:37328 (R;US)
Monte Carlo algorithms for lattice gauge theory, 12:38215 (R;US)
Monte Carlo determination of the spin-dependent potentials, 12:38155 (R;US)
Particle Bed Reactor scaling relationships, 12:36784 (R;US)
Plant lifetime reliability and risk: Addressing today's strategies for making tomorrow's decisions, 12:36823 (R;US)
Radon source rate measurements using multiple perfluorocarbon tracers, 12:37709 (R;US)
Review of the Brookhaven neutrino workshop, 12:38113 (R;US)
Shelf Edge Exchange Processes: Phase 1 (SEEP-1), Hydrography report, July 1983-October 1984, 12:38049 (R;US)
Some thoughts on the muon catalyzed fusion reactor, 12:38320 (R;US)
Studies of hypernuclei by associated production, 12:38237 (R;US)
$\nu$/sub $\mu$/e $\rightarrow$ $\nu$/sub $\mu$/e and $\nu$/sub $\mu$/p $\rightarrow$ $\nu$/sub $\mu$/p, 12:38114 (R;US)
Tests of candidate materials for particle bed reactors, 12:36780 (R;US)
The application of a synchrotron radiation microprobe to trace element analysis, 12:37873 (R;US)
The role of dry deposition in acidification of waters, 12:37767 (R;US)
Thermal-hydraulic considerations for particle bed reactors, 12:36781 (R;US)
Tranverse beam break up in a periodic linac, 12:37540 (R;US)
Two-zone modelling for air exchange rates and $NO_2$ source and decay rates in a Southern California residential indoor air quality study, 12:37600 (R;US)
**Brown Univ., Providence, RI (USA). Dept. of Physics**
A research program in experimental high energy physics: Task B, Progress report for contract period January 1, 1987 to December 31, 1987, 12:38120 (R;US)
A research program in experimental high energy physics: Task C, Progress report for contract period January 1, 1987 to December 31, 1987, 12:38118 (R;US)
A research program in theoretical high-energy physics: Progress report, 12:38158 (R;US)
Elastic scattering of muon neutrinos at BNL, 12:38115 (R;US)
Inclusive charged and neutral pion photoproduction at 20 GeV, 12:38119 (R;US)
Research program in computational physics: [Progress report for Task D], 12:38159 (R;US)
**Brown Univ., Providence, RI (USA). Div. of Engineering**
Micropore diffusion in coal chars under reactive conditions: Quarterly technical progress report, 15 December 1986-15 March 1987, 12:36271 (R;US)
**Bundesforschungsanstalt fuer Ernaehrung, Karlsruhe (Germany, F.R.)**
Radioactivity in foods - Chernobyl and the consequences, 12:37817 (R;DE;In German)
**Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene**
Carbon and carbon metabolism in the environment, 12:37905 (R;DE)
Comparative investigations of different measurement methods of Radiochromatograms for the evaluation of the radiochemical purity of ten radiopharmaceuticals, 12:37438 (R;DE;In German)
Influence of radiation treatment on pharmaceuticals and auxiliary ingredients. A review. Pt. 7, 12:37440 (R;DE;In German)
Radiochemical purity and stability of I-131/I-125/I-123 o-iodohippuric acids. A market analysis, 12:37439 (R;DE;In German)
Results of the activity measurements after the reactor accident in Chernobyl, 12:37710 (R;DE;In German)
Treatment of spices with ionizing radiation - chemical, organoleptical, microbiological and toxicological analyses. Pt. 1, 12:37898 (R;DE;In German)
Treatment of spices with ionizing radiation - chemical, organoleptical, microbiological and toxicological analyses. Pt. 2, 12:37899 (R;DE;In German)

**Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.)**
Biomass production of problematic sites by generatively and vegetatively propagated high-yield-progenies of fast growing tree species. Final report, 12:36621 (R;DE;In German)
Construction and testing of a pyrolysis plant for disposal of special wastes with recovery of raw materials and energy. Final report, 12:37521 (R;DE;In German)
Fly ash quality as a function of burned coal and layout of firing equipment, and suitability of different fly ash qualities for use in industry. Final report, 12:36325 (R;DE;In German)
Recovery and utilization of landfill gas at the landfill 'Am Lemberg', Landkreis Ludwigsburg. Pt. 3. Results of the investigation program. Final report, 12:36580 (R;DE;In German)
Utilization of solid matter and the saving of energy within the sphere of the sugar industry by means of the biotechnical use of extracted cossettes - Phase 2. Final report, 12:36596 (R;DE;In German)
**Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany, F.R.)**
Example of the structure of the steel used in manufacture for nuclear power station components, taking welding and heat treatment into special account (5. Technical report. Pt. 2), 12:37202 (R;DE;In German)
Possibilities of hydrogen removal phase III: Selected countermeasures of hydrogen mitigation for hypothetical accidents in a pressurized water reactor, 12:36822 (R;DE;In German)
**Bureau of Mines, Avondale, MD (USA). Avondale Research Center**
Effects of sheltering and orientation on the atmospheric corrosion of structural metals, 12:37634 (R;US)

Evaluating ventilation parameters of three coal-mine gobs. Information circular/1986, 12:36342 (R;US)
Wood crib fires in a ventilated tunnel. Report of Investigations/1986, 12:36366 (R;US)
**Bureau of Mines, Salt Lake City, UT (USA). Salt Lake City Research Center**
Utilization and stabilization of mineral wastes. Bulletin, 12:37672 (R;US)
**Bureau of Reclamation, Denver, CO (USA). Engineering and Research Center**
Study of saline water use at the Harry Allen Generating Station. Final report, 12:36756 (R;US)

## C

**California Dept. of Health Services, Berkeley (USA). Air and Industrial Hygiene Lab.**
Dry deposition of acidic gases and particles. Final report, 12:37667 (R;US)
**California Inst. of Tech., Pasadena (USA). Environmental Quality Lab.**
Control of atmospheric fine primary carbon particle concentrations. Final report, 12:37654 (R;US)
**California Univ., Berkeley (USA). Coll. of Engineering**
Surface properties of coal and their role in coal beneficiation: Technical progress report, 16 March 1987-15 June 1987, 12:36318 (R;US)
**California Univ., Berkeley (USA). Dept. of Chemical Engineering**
Continuous thermodynamics for phase equilibria and enthalpy calculations. Annual report, September 1, 1985-December 31, 1986, 12:36464 (R;US)
**California Univ., Berkeley (USA). Dept. of Chemistry**
Picosecond studies of multiphoton absorption: Final technical report, 12:37395 (R;US)
**California Univ., Berkeley (USA). Dept. of Computer Sciences**
Trace-driven simulation study of dynamic load balancing. Technical report, 7 August 1984-6 August 1987, 12:38416 (R;US)
**California Univ., Berkeley (USA). Dept. of Materials Science and Mineral Engineering**
Aluminum substitutions in Nd-Fe-B sintered magnets, 12:37224 (R;US)
Generation and analysis of stable excavation shapes under high rock stresses, 12:38044 (R;US)
**California Univ., Berkeley (USA). Electronics Research Lab.**
Plasma theory and simulation. Quarterly progress report Nos. 3 and 4, 1 July-31 December 1985, 12:38319 (R;US)
**California Univ., Los Angeles (USA)**
AES and RBS studies of TiN and TiC coatings prepared by the activated reactive evaporation (ARE) process, 12:37286 (R;US)
**California Univ., Los Angeles (USA). Dept. of Chemistry and Biochemistry**
Time-resolved laser studies on the proton pump mechanism of bacteriorhodopsin: Progress report, December 1, 1984-November 30, 1987, 12:36640 (R;US)
**California Univ., Los Angeles (USA). Tokamak Fusion Lab.**
Ray tracing analysis of LH [lower hybrid] fast waves in CCT [Continuous Current Tokamak], 12:38355 (R;US)
**California Univ., San Diego (USA)**
Selection of earthquake resistant design criteria for nuclear power plants: Methodology and technical cases: Dislocation models of near-source earthquake ground motion: A review, 12:36928 (R;US)
**California Univ., Santa Barbara (USA). Dept. of Electrical and Computer Engineering**
The structure of GaAs/Si(211) heteroepitaxial layers, 12:37340 (R;US)
**Carnegie-Mellon Univ., Pittsburgh, PA (USA). Dept. of Chemical Engineering**
A program of basic research on the preparation and stability of coal/water slurries: Final report, 12:36360 (R;US)
**Carnegie-Mellon Univ., Pittsburgh, PA (USA). Dept. of Civil Engineering**
Adsorption of nitrogen-heterocyclic compounds on oxide surfaces: Final report for the period September 1, 1984-November 31, 1986, 12:37396 (R;US)
**Case Western Reserve Univ., Cleveland, OH (USA). Dept. of Mechanical and Aerospace Engineering**
Laser velocimeter measurements of solids in multiphase flow: Quarterly technical progress report covering the period March 1, 1987 to May 31, 1987, 12:37493 (R;US)
**Caterpillar Tractor Co., Peoria, IL (USA)**
Application for certification 1987 model year heavy-duty engines - Caterpillar, 12:37169 (R;US)
**CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France). Service des Basses Temperatures**
The Fermi surface of CeSb, 12:37205 (R;US)
**CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI)**
Vignola project, 12:36654 (R;FR;In French)
**Center for Neighborhood Technology, Chicago, IL (USA)**
Energy conservation business opportunities in multifamily housing: Executive summary and conclusions: [Final report], 12:37061 (R;US)
Energy conservation business opportunities in multifamily housing: Energy-efficient manufactured housing in Chicago: Part 1, Industry assessment and business concept paper: [Final report], 12:37063 (R;US)
Energy conservation business opportunities in multifamily housing: Feasibility analysis/business plan for proposed residential balancing venture: [Final report], 12:37062 (R;US)
**Central Intelligence Agency, Washington, DC (USA)**
International Energy Statistical Review. Monthly report, 12:36986 (R;US)
**Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)**
Pilot scale (100 kW) water electrolysis plant based on inorganic-membrane-electrolyte technology. Final report, 12:36575 (R;DE)
**Centre National de la Recherche Scientifique, 38 - Grenoble (France). Centre de Recherches sur les Tres Basses Temperatures**
Specific heat of heavy-fermion $CeCu_6$: Effect of pressure and magnetic field, 12:37227 (R;US)
**Centro de Pesquisas de Energia Eletrica, Rio de Janeiro (Brazil)**
Composite generation-transmission expansion planning: Final report, 12:36770 (R;US)

**CeramPhysics, Inc., Westerville, OH (USA)**
Capacitive energy storage at cryogenic temperatures. Annual report, 1 January-31 December 1986, 12:36937 (R;US)
**Chicago Univ., IL (USA)**
Organization and regulation of the genes for nitrogen fixation in Rhodopseudomonas capsulata: Progress report for the period June 5, 1986-June 4, 1987, 12:37862 (R;US)
Theoretical high energy physics research at the University of Chicago: Technical progress report [for 1986], 12:38160 (R;US)
**Chicago Univ., IL (USA). Dept. of Geophysical Sciences**
The application of a synchrotron radiation microprobe to trace element analysis, 12:37873 (R;US)
**Christian Michelsens Inst. for Vitenskap og Aandsfrihet, Bergen (Norway)**
Economic analysis of natural gas contracts, 12:36435 (R;NO)
Optimal investments using empirical dynamic programming with application to natural resources, 12:36436 (R;NO)
Petroleum taxes and optimal resource recovery, 12:36414 (R;NO)
Progress curves for North Sea platform projects, 12:36415 (R;NO)
Rate-sensitivity and the optimal choice of production capacity of petroleum reservoirs, 12:36371 (R;NO)
Safety and optimal prevention of platform accidents, 12:36413 (R;NO)
**Chrysler Corp., Detroit, MI (USA)**
Application for certification 1987 model year heavy-duty engines - Chrysler, 12:37170 (R;US)
Application for certification 1987 model year light-duty vehicles - Chrysler, 12:37173 (R;US)
**City Coll., New York (USA)**
Experimental investigations of production of glueballs and meson resonant states, 12:38123 (R;US)
**City Univ. of New York, NY (USA). Research Foundation**
Experimental investigations of production of glueballs and meson resonant states, 12:38123 (R;US)
**Cliffs Engineering, Inc., Rifle, CO (USA)**
Indiana Shale Oil Development Project: Program for design and operation of a 500 BPD demonstration plant: Final report, Volume 2, 12:36477 (R;US)
**Coast Guard Research and Development Center, Groton, CT (USA)**
United States Coast Guard portable salvage computer. Final report, 12:36956 (R;US)
**College of William and Mary, Williamsburg, VA (USA). Dept. of Physics**
CEBAF [Continuous Electron Beam Accelerator Facility] scientific program, 12:38230 (R;US)
**Colorado School of Mines, Golden (USA)**
Shock-modified transition metal ferrites, 12:37348 (R;US)
**Colorado School of Mines, Golden (USA). Dept. of Chemical Engineering and Petroleum Refining**
Low severity coal liquefaction using homogeneous basic nitrogen catalysts: Technical progress report, February-April 1987, 12:36272 (R;US)
**Colorado School of Mines, Golden (USA). Inst. for Energy Resource Studies**
Projections of cost of development of US natural gas potential: Final report, 12:36437 (R;US)
**Colorado Univ., Boulder (USA)**
Master-equation approach to collisionally induced absorption and emission, 12:38093 (R;US)
**Colorado Univ., Boulder (USA). Dept. of Astrophysical, Planetary, and Atmospheric Sciences**
Vector-array-processor computer equipment. Final report, 1 January-31 December 1985, 12:38052 (R;US)
**Columbia Univ., New York (USA). Columbia Astrophysics Lab.**
Program of ground-based astronomy to complement Einstein observations. Final report, 1 October 1981-30 September 1986, 12:38050 (R;US)
**Columbia Univ., New York (USA). Dept. of Physics**
Theoretical high energy physics: Progress report for the period May 1, 1986-April 30, 1987, 12:38157 (R;US)
**Combustion Engineering Association, London (UK)**
Low temperature heat recovery, 12:37104 (R;GB)
**Combustion Engineering, Inc., Windsor, CT (USA)**
Development of an advanced high efficiency coal combustor for boiler retrofit: Quarterly report for the period November 1986 to January 1987, 12:36361 (R;US)
**Commission of the European Communities, Luxembourg**
Alfa Romeo modular taxi: Demonstration project. Final report, 12:37162 (R;FR)
Basic characteristics for low-cost houses in order to reduce the energy consumption for heating, 12:37068 (R;FR)
Continuous production of photovoltaic silicon ribbons by the new pendant drop growth (PDG) method, 12:36629 (R;XE)
Exploitation of asphalts by hydrogenation in extreme conditions using introduced catalysts. Final report, 12:36276 (R;XE;In French)
Passenger-car emissions in the speed range 80-120 kmph. Traffic measurements on a fleet of cars in the Pfaender Road Tunnel, 12:37183 (R;XE;In German)
Quality and quantity of latex which can be produced from natural vegetation in Greece, 12:36630 (R;FR)
Short-rotation harvester/chipper, 12:36633 (R;XE)
Solar energy: European research and development. Contractors' catalogue 1984, 12:36619 (R;XE)
**Commission of the European Communities, Luxembourg. Directorate General Information Market and Innovation**
Energy storage in phase-change materials. Development of a component model compatible with the 'TRNSYS' transient simulation program. Final report, 12:36938 (R;DE)
Photochemical dissociation of water: Development and study of new heterogeneous catalysts. Final report, 12:36576 (R;DE)
Pilot scale (100 kW) water electrolysis plant based on inorganic-membrane-electrolyte technology. Final report, 12:36575 (R;DE)
**Community Action Commission of Fayette County, Washington Court House, OH (USA)**
Code name: Opportunity battery: Phases 1 and 2 of Department of Energy Business Plan, 12:38392 (R;US)
**COMSIS Corp., Wheaton, MD (USA)**
A case study of the commercialization of the diesel engine in the domestic light duty vehicle market: Final report, 12:37161 (R;US)
Baltimore feeder-bus planning study. Final report, 12:37100 (R;US)

A concept for an advanced computer-based building envelope design tool, 12:37072 (R;US)
A TEM [transmission electron microscopy] study of rhodium on GaAs: Reactions and morphology, 12:37514 (R;US)
Aluminum substitutions in Nd-Fe-B sintered magnets, 12:37224 (R;US)
Combined NO/sub x//$SO_2$ removal from flue gas using ferrous chelates of SH-containing amino acids and alkali, 12:36329 (R;US)
Congruent reduction and mode conversion in 4-dimensional plasmas, 12:38342 (R;US)
Development and applications of NMR [nuclear magnetic resonance] in low fields and zero field, 12:37506 (R;US)
Effect of Dy additions on microstructure and magnetic properties of Fe-Nd-B magnets, 12:37225 (R;US)
Energetic particle emission and linear momentum transfer in central collisions induced by 32.5 MeV/nucleon $^{16}O + ^{238}U$, $^{197}Au$, 12:38261 (R;US)
Energy use and peak power for new commercial buildings from the BECA-CN [Buildings Energy-Use Compilation and Analysis] data compilation: Key findings and issues, 12:37073 (R;US)
Energy use test procedures for appliances: A case study of Japanese refrigerators, 12:37027 (R;US)
Energy-efficient new commercial buildings in the Northwest Region: A compilation of measured data, 12:37066 (R;US)
Enthusiasms and realities in advanced materials, 12:37196 (R;US)
Generation and analysis of stable excavation shapes under high rock stresses, 12:38044 (R;US)
Heavy-ion effects on cellular and subcellular systems: Inactivation, chromosome aberrations and strand breaks induced by iron and nickel ions, 12:37904 (R;DE)
Hydraulic and mechanical properties of natural fractures in low-permeability rock, 12:38043 (R;US)
Interactive software for simulation of high resolution TEM images, 12:38411 (R;US)
Ion beam characterization of thin film metal/GaAs interface reactions, 12:37513 (R;US)
Magnetic susceptibility of AuFe: T/sub g/ and Curie-Weiss parameters, 12:37226 (R;US)
Measurement of electron beam polarization at the SLC, 12:37564 (R;US)
MINC [Multiple Interacting Continua]: An approach for analyzing transport in strongly heterogeneous systems, 12:38037 (R;US)
Nonlinear-spectroscopic studies of highly excited states of molecules in supersonic beams, 12:38096 (R;US)
NO/sub x/ and $SO_2$ removal from flue gas by ferrous ion-peptide solutions, 12:36330 (R;US)
Numerical solution of the Hele-Shaw equations, 12:38103 (R;US)
Permeability of shale at elevated temperature and pressure: Test methodology and preliminary results, 12:36522 (R;US)
Probing the direct step of relativistic heavy ion fragmentation: ($^{12}C$, $^{11}B$+p) at 2.1 GeV/nucleon with C and $CH_2$ targets, 12:38239 (R;US)
Pulsed zero field NMR of solids and liquid crystals, 12:38299 (R;US)
Quantum chemical methods for massively parallel computers, 12:38308 (R;US)
Specific heat of heavy-fermion $CeCu_6$: Effect of pressure and magnetic field, 12:37227 (R;US)
Specific heat of (U/sub 0.97/Th/sub 0.03/)$Be_{13}$ under pressure, 12:37228 (R;US)
Successful molecular beam epitaxy growth and characterization of (110) GaAs/GaAs and (110) AlGaAs/GaAs, 12:37339 (R;US)
The development and application of energy derivative methods for various types of configuration interaction wave functions in ab initio electronic structure theory, 12:37402 (R;US)
The impacts of balanced and exhaust mechanical ventilation on indoor radon, 12:37712 (R;US)
The magnet lattice of the LBL 1-2 GeV Synchrotron Radiation Source, 12:37561 (R;US)
The standard model and colliders, 12:38218 (R;US)
The structure of GaAs/Si(211) heteroepitaxial layers, 12:37340 (R;US)
Two dimensional NMR of liquids and oriented molecules, 12:37401 (R;US)
ZAP and its application to the optimization of synchrotron light source parameters, 12:37560 (R;US)
**Lawrence Livermore National Lab., CA (USA)**
A design procedure to tune the dynamic stiffness of an externally pressurized gas bearing, 12:37469 (R;US)
A high gain free electron laser amplifier design for the Alcator-C tokamak, 12:37518 (R;US)
A study of Economy of Force: An analysis of varying the size of a main and secondary taskforce against a dynamic defense, 12:38400 (R;US)
Adaptive methods for high Mach number reacting flow, 12:37502 (R;US)
An attempt to use high resolution FTIR spectra to determine the population of the various nitrate esters in cellulose nitrate, 12:37381 (R;US)
An evaluation of three temperature controllers for a +-0.002°C application, 12:37467 (R;US)

An experiment to measure the electron neutrino mass using a cryogenic tritium source, 12:38198 (R;US)
An overview of copper-laser development for isotope separation, 12:36481 (R;US)
Brittle fracture phenomena: An hypothesis, 12:38048 (R;US)
Chemistry and Materials Science quarterly research report: Weapons-Supporting Research and departmental Institutional Research and Development: Second quarter FY87, 12:37197 (R;US)
Concentrations of radionuclides in fish collected from Bikini Atoll between 1977 and 1984, 12:37852 (R;US)
Configurational energies in terms of effective cluster interactions in binary substitutional alloys: Connection between the Embedded Cluster Method and the Generalized Perturbation Method, 12:37245 (R;US)
Creep of austenitic stainless steels at room temperature, 12:37256 (TG;US)
Data collection and presentation procedures for the US Army's Chemical Hazard Assessment Warning System (CHAWS), 12:37706 (R;US)
Demilitarization of conventional ordnance: Priorities for database assessments of environmental contaminants, 12:37584 (R;US)
Direct implicit electromagnetic plasma simulation, 12:38356 (R;US)
Engineering Research Division publication report, Calendar year 1986, 12:37447 (R;US)
Evidence for differences in stability between nitrate ester positions on the cellulose nitrate ring, 12:37585 (R;US)
FDAS hardware and firmware description, liquefied gaseous fuels (LGF) data acquisition system: 1987 update, 12:36438 (R;US)
FEA predictions of residual stress in stainless steel compared to neutron and x-ray diffraction measurements, 12:37244 (R;US)
High average power solid state laser developments at the Lawrence Livermore National Laboratory, 12:37487 (R;US)
Importance and sensitivity of parameters affecting the Zion Seismic Risk, 12:36932 (R;US)
Important atomic physics issues for ion beam fusion, 12:38383 (R;US)
Lawrence Livermore National Laboratory Oil Shale Project: Quarterly report, January-March 1987, 12:36470 (R;US)
Measurement of x-ray dielectric constants with coherent transition radiation, 12:37509 (R;US)
Molecular approaches to the detection of germinal mutations in mammalian organisms, including man, 12:38007 (R;US)
Molecular dynamics studies of energy transfer processes in crystal systems: Annual summary report, 12:38302 (R;US)
Multimegajoule laser design, 12:37486 (R;US)
Near spherical illumination of ion-beam and laser targets, 12:38384 (R;US)
Numerical assessment of high frequency (HF) antennas for shipboard use, 12:37466 (R;US)
Numerical simulation of flow in Brush Creek Valley, Colorado, 12:37728 (R;US)
Numerical solutions for laminar flow over a backward-facing step, 12:38104 (R;US)
Performance analysis of the two-stage light gas gun, 12:37468 (R;US)
Pressure safety training for a large research and development facility, 12:38017 (R;US)
Production of methanol and light hydrocarbons on $ThO_2$ and doped-$ThO_2$ from $CO + H_2$ mixtures, 12:36603 (R;US)
Promethium ($Pm^{3+}$) solid state laser, 12:37474 (R;US)
Radiation effects limits on superconducting magnets: Data base for copper stabilizers, 12:37243 (R;US)
Response of a pulse combustor to changes in total ignition delay time, 12:37523 (R;US)
Sensitivity of piping seismic responses to input factors, 12:36931 (R;US)
Symmetry issues in a class of ion beam targets using sufficiently short direct drive pulses, 12:38385 (R;US)
The Livermore Security Console system, 12:36572 (R;US)
Tritium in groundwater at Site 300, 12:37853 (R;US)
X-ray laser world wide progress, 12:37488 (R;US)

**Lehigh Univ., Bethlehem, PA (USA). Dept. of Chemistry**
Low severity coal conversion by ionic hydrogenation: [Progress report], April 1 to June 30, 1987, 12:36270 (R;US)

**Lincoln, City of, NE (USA)**
Proposed haymarket district heating and cooling system, Lincoln, Nebraska: Phase 1, Feasibility report, 12:37155 (R;US)

**Lincoln Coll., Canterbury (New Zealand). Dept. of Agricultural Engineering**
Wind energy resource survey of New Zealand: Phase 1, National survey using existing data: Detailed technical report, 12:36735 (R;NZ)

**Lincoln Electric System, NE (USA)**
Proposed haymarket district heating and cooling system, Lincoln, Nebraska: Phase 1, Feasibility report, 12:37155 (R;US)

**Little (Arthur D.), Inc., Cambridge, MA (USA)**
Guidelines for the selection of chemical-protective clothing. Volume 2. Technical and reference manual. (3rd Edition). Report for January 1985-March 1987, 12:37449 (R;US)
Guidelines for the selection of chemical-protective clothing. Volume 1. (3rd Edition). Report for January 1985-May 1987, 12:37451 (R;US)
Testing to determine relationship between explosive-contaminated sludge components and reactivity. Final report, June 1985-January 1987, 12:37837 (R;US)

**Lockheed Engineering and Management Services Co., Inc., Las Vegas, NV (USA)**
National Surface Water Survey: Western Lake Survey-Phase 1 (synoptic chemistry) field operations report, 12:37844 (R;US)
Soil-gas measurement for detection of subsurface organic contamination, 12:37810 (R;US)

**Lockheed Missiles and Space Co., Inc., Palo Alto, CA (USA). Research and Development Div.**
Effect of alloying, rapid solidification, and surface kinetics on the high-temperature environmental resistance of niobium. Annual technical report, November 1985-January 1986, 12:37198 (R;US)

**Los Alamos National Lab., NM (USA)**
A neutron portal monitor for vehicles, 12:36562 (R;US)
A study of the effects of penetration framing on steel containment buckling capacity, 12:36805 (R;US)
An experimental measurement of metal multilayer x-ray reflectivity degradation due to intense x-ray flux, 12:38298 (R;US)
Cherenkov and transition radiation diagnostics for high energy free-electron lasers, 12:37483 (R;US)
Environmental surveillance at Los Alamos during 1986, 12:37711 (R;US)
Evaluation of materials by the energy yield of an active system, 12:36684 (R;US)
Field-reversed configuration formation and confinement studies on the LSM device, 12:38341 (R;US)
Groundwater chemistry at Yucca Mountain, Nevada, and vicinity, 12:36519 (R;US)
Heavy electron superconductivity: From 1K to 90K to ?, 12:38306 (R;US)
High density Z pinch formed from a solid deuterium fiber, 12:38340 (R;US)
High-strain-rate deformation mechanisms in copper and implications for behavior during shock-wave deformation, 12:37223 (R;US)
Hot-spot reaction in unsustained shocks, 12:37582 (R;US)
Infiltration at Yucca Mountain, Nevada, traced by $^{36}Cl$, 12:36520 (R;US)
Influence of peak pressure on the substructure evolution and mechanical properties of shock-loaded 6061-T6 aluminum, 12:37221 (R;US)
Low-thrust rocket trajectories, 12:36821 (R;US)
Modeling study of solute transport in the unsaturated zone: Workshop proceedings, 12:37850 (R;US)
New portable hand-held radiation instruments for measurements and monitoring, 12:36561 (R;US)
Optical analysis of high power free electron laser resonators, 12:37484 (R;US)
Oxidation of heterocyclic amines, sulfilimines, and phosphine imines with dimethyldioxirane, 12:37400 (R;US)
Performance correlations for high temperature potassium heat pipes, 12:36803 (R;US)
Pressure and intracorporal acceleration measurements in pigs exposed to strong shock waves in a free field, 12:38015 (TG;US)
Specific heat of (U/sub 0.97/Th/sub 0.03/)$Be_{13}$ under pressure, 12:37228 (R;US)
Structural relaxation in Pd-Ge metallic glass, 12:37222 (R;US)
The Cliper Data Acquisition System, 12:37594 (R;US)
The R and D/operational MC and A [materials control and accounting] interface, 12:36560 (R;US)

The shell model for hot-spot ignition, 12:37581 (R;US)
Understanding photoemission spectra in uranium based heavy fermion systems, 12:37204 (R;US)
Vehicle tracking systems, 12:38396 (R;US)
Whisker reinforced structural ceramics: Progress in the VLS growth and use of long silicon carbide whiskers, 12:37300 (R;US)
Work performance evaluation using the exercising rat model, 12:37959 (R;US)
**Los Alamos Scientific Lab., NM (USA)**
Operation Greenhouse. Scientific director's report of atomic weapon tests at eniwetok, 1951. Annex 9.1. Staff reports. Parts 1 to 4. Annex 9.4. Documentary photography, 12:37590 (R;US)
**Louisiana State Univ., Baton Rouge (USA). Dept. of Physics and Astronomy**
Electronic properties of two-dimensional systems in sub-micron devices: Final report, September 1, 1985-November 30, 1986, 12:38297 (R;US)
**Louisiana State Univ., Baton Rouge (USA). Nuclear Science Center**
Diffusion theory calculations for the pin-wise power distribution in VENUS-I and VENUS-II, 12:36777 (R;US)
**Lowell Univ., MA (USA). Center for Atmospheric Research**
Preliminary investigation of ionospheric modifucation using oblique-incidence high-power h-f (high-frequency) radio waves. Technical report, 12:38082 (R;US)

## M

**Maine Development Foundation, Augusta (USA)**
Energy related business development project: Final report, 12:38391 (R;US)
**Mainz Univ. (Germany, F.R.)**
Towards /sup 100/Sn: Studies on neutron-deficient even isotopes of tin, 12:38252 (R;DE)

Executive summary of long-range environmental management plans: FY 1987-1993, 12:36960 (R;US)
Resource Management Plan for the Oak Ridge Reservation: Volume 23, Oak Ridge National Environmental Research Park, Research Sites, and State Natural Areas, 12:36963 (R;US)
**Martin Marietta Environmental Systems, Columbia, MD (USA)**
Air-quality impact analysis for Easton Utilities Commission Power Plant No. 2, units 23 and 24. Final report, 12:36762 (R;US)
**Maryland Energy Administration, Annapolis (USA)**
Alternative energy sources guidebook. Final report, 12:37003 (R;US)
**Maryland Univ., College Park (USA)**
Radiative tau pair production and search for new particles decaying into tau, 12:38117 (R;DE)
Short range phenomena, 12:38161 (R;US)
**Maryland Univ., College Park (USA). Dept. of Mathematics**
Numerical solutions for laminar flow over a backward-facing step, 12:38104 (R;US)
**Maryland Univ., College Park (USA). Dept. of Physics and Astronomy**
Nonperturbative extension of the light-front QCD, 12:38267 (R;US)
**Mason and Hanger-Silas Mason Co., Inc., Amarillo, TX (USA)**
Environmental monitoring report for Pantex Plant covering 1986, 12:36550 (R;US)
**Massachusetts General Hospital, Boston (USA)**
Characterization of porosity in green-state and partially densified Al/sub 2/O/sub 3/ by nuclear magnetic resonance imaging, 12:37284 (R;US)
**Massachusetts Inst. of Tech., Cambridge (USA)**
Preliminary conceptual design study for a small LWR: Final report, 12:36772 (R;US)
**Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Materials Science and Engineering**
Microstructure, resistivity and the anisotropy of the upper critical field in NbN thin films, 12:37283 (R;US)
**Massachusetts Inst. of Tech., Cambridge (USA). Microsystems Research Center**
Coherent VLSI environment. Semiannual technical report, 1 October 1986-31 March 1987, 12:38402 (R;US)
**Massachusetts Inst. of Tech., Cambridge (USA). Nuclear Reactor Lab.**
Nuclear reactor and materials science research: Final technical report, May 1, 1985-September 30, 1986, 12:36819 (R;US)
**Massachusetts Inst. of Tech., Cambridge (USA). Plasma Fusion Center**
Alcator pellet evaporation data and the classical flux limit parameter, 12:38339 (R;US)
Fast-wave transmission and reflection in ion-cyclotron heating, 12:38328 (R;US)
Modeling of ICRH experiments in the Tara tandem mirror, 12:38327 (R;US)
Modification of tokamak ballooning stability boundaries by alpha populations, 12:38323 (R;US)
Studies of the regime of improved particle and energy confinement following pellet injection into Alcator C, 12:38326 (R;US)
**Massachusetts Inst. of Tech., Cambridge (USA). Research Lab. of Electronics**
Measurements of amplification and phase shift (wave refractive index) in a free-electron laser, 12:37472 (R;US)
**Max-Planck-Institut fuer Physik und Astrophysik, Muenchen (Germany, F.R.)**
Excited lepton search, 12:38116 (R;DE)
**Max-Planck-Institut fuer Physik und Astrophysik, Muenchen (Germany, F.R.). Werner-Heisenberg-Inst. fuer Physik**
Low-light-level video system for data acquisition from optical particle detectors, 12:37565 (R;DE)
**Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)**
Investigation of density fluctuations in the edge region of the divertor tokamak ASDEX, 12:38338 (R;DE;In German)
**McDonnell Aircraft Co., St. Louis, MO (USA)**
Technology development of antennas for ion cyclotron heating experiments in fusion devices, 12:38374 (R;US)
**Mercedes-Benz of North America, Inc., Montvale, NJ**
Application for certification 1987 model year light-duty vehicles - Mercedes-Benz, 12:37176 (R;US)
**Michigan State Univ., East Lansing (USA)**
Effects of acidification on stream ecosystems, 12:37843 (R;US)
**Michigan Technological Univ., Houghton (USA). Inst. of Materials Processing**
Development and demonstration of a static tube flotation system for producing superclean coal: Technical progress report, 7th quarterly ending 6/30/87, 12:36236 (R;US)
**Michigan Univ., Ann Arbor (USA). Biological Station**
Interaction of $H_2O$ and nitrogen stresses on trees: Progress report, 1 October 1986 to 30 September 1987, 12:36627 (R;US)
**Ministere de la Qualite de la Vie, 75 - Paris (France)**
Study of fog formation and developments on the industrial plants at Lacq (France). Role of condensation nuclei, 12:37608 (R;FR;In French)
**Minnesota Univ., Minneapolis (USA). Dept. of Chemical Engineering and Materials Science**
Understanding photoemission spectra in uranium based heavy fermion systems, 12:37204 (R;US)

**Mississippi State Univ., Mississippi State (USA). MHD Energy Center**
Particle evolution in MHD systems, 12:37005 (R;US)
**Mississippi Univ., University (USA). Dept. of Biology**
Biodegradation and bioconversion of coals by fungi: Technical report No. 7 for the period March 1, 1987-May 31, 1987, 12:36315 (R;US)
**Missouri Univ., Columbia (USA). Dept. of Chemistry**
Characterization, renovation, and utilization of water from slurry-transport systems, 12:36348 (R;US)
**Missouri Univ., Columbia (USA). Research Reactor Facility**
Mirror and Bragg reflections of neutrons at a nuclear resonance: [Final technical report], 12:38292 (R;US)
**Mitre Corp., McLean, VA (USA)**
Analysis of balance-of-plant regulatory issues: Final report, 12:36926 (R;US)
**Mitsubishi Jukogyo K.K., Tokyo (Japan)**
System for removing contaminated surface layers, 12:36807 (TG;US)
**Mitsubishi Motors Corp., Tokyo (Japan)**
Application for certification 1987 model year heavy-duty engines - Mitsubishi Motors corporation, 12:37171 (R;JP)
**Monsanto Research Corp., Miamisburg, OH (USA). Mound**
A measurement control study for tritium gas, 12:36563 (R;US)
Mechanical testing of carbon foam, 12:37341 (R;US)
Single zone control systems, 12:37074 (R;US)
The application of variable explosive chamber testing to actuator testing, 12:37583 (R;US)
**Montana State Univ., Bozeman (USA)**
Surface chemistry of model Co-Mo catalysts supported on planar g-Al/sub 2/O/sub 3/: Quarterly technical progress report for period March 1, 1987 to May 31, 1987, 12:36268 (R;US)
**Montana Univ., Missoula (USA). Wood Chemistry Lab.**
Kinetics of chemisorption and gasification reactions of carbon for evaluation of the role of electron-transfer processes. Annual report, January-December 1986, 12:36460 (R;US)
**Myrias Research Corp., Edmonton, Alberta (Canada)**
An optical model analysis of $^{16}O + ^{12}C$ elastic scattering at E/A = 94 MeV, 12:38266 (R;US)

## N

**National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center**
Investigation of PTFE transfer films by infrared emission spectroscopy and phase-locked ellipsometry, 12:37344 (R;US)
Shot peening for Ti-6Al-4V alloy compressor blades, 12:37229 (R;US)
Status of commercial fuel cell powerplant system development, 12:37012 (R;US)
Styrene-terminated polysulfone oligomers as matrix material for graphite reinforced composites: an initial study, 12:37346 (R;US)
Superalloy resources: Supply and availability, 12:37230 (R;US)
**National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center**
Algorithm implementation on the Navier-Stokes computer, 12:37495 (R;US)
Baseline tensile tests of composite materials for LDEF (Long duration exposure facility) exposure, 12:37342 (R;US)
Remarks on the stability analysis of reactive flows, 12:37442 (R;US)
Simplified method for determining heat of combustion of natural gas, 12:36462 (R;US)
Solar power absorption in a glass tube, 12:36704 (R;US)

**Oak Ridge Associated Universities, Inc., TN (USA)**
Antiphase boundaries in $\beta$-SiC thin films, 12:37289 (R;US)
**Oak Ridge National Lab., TN (USA)**
A method to automate the radiological survey process, 12:37819 (R;US)
A proposed classification system for high-level and other radioactive wastes, 12:36524 (R;US)
A review of the organic geochemistry of shales, 12:36526 (R;US)
Adaptive transmission relaying concepts for improved performance, 12:36767 (R;US)
An intelligent thick-film gas sensor: development and preliminary tests, 12:37378 (R;US)
An optical model analysis of $^{16}O + {}^{12}C$ elastic scattering at E/A = 94 MeV, 12:38266 (R;US)
Angular momentum effects in subbarrier fusion, 12:38251 (R;US)
Antiphase boundaries in $\beta$-SiC thin films, 12:37289 (R;US)
Application of analytical electron microscopy to design of creep resistant advanced austenitic stainless steels, 12:37210 (R;US)
Application of XAD-4 solid sorbent and HPLC [high performance liquid chromatography] with electrochemical detection to the analysis of phenols in water: Final report, November 1983-November 1985, 12:37377 (R;US)
Assessment of energy storage concepts for use in pulsed space power systems, 12:36786 (R;US)
Biomedical and Environmental Sciences Programs: Publications 1986, 12:37859 (R;US)
Calculated neutron-induced cross sections for /sup 58,60/Ni from 1 to 20 MeV and comparisons with experiments, 12:38274 (R;US)
Configurational energies in terms of effective cluster interactions in binary substitutional alloys: Connection between the Embedded Cluster Method and the Generalized Perturbation Method, 12:37245 (R;US)
Considerations on a de minimis dose and disposal of exempt concentrations of radioactive wastes, 12:36525 (R;US)

Consolidated Fuel Reprocessing Program: Progress report for period October 1 to December 31, 1986, 12:36488 (R;US)
Correlations among thermal processing, superconducting properties, and microstructure in La/sub 1.85/Sr/sub 0.15/ $CuO_4$, 12:37291 (R;US)
Design and use of the Embrittlement Data Base (EDB), 12:36802 (R;US)
Development of iron aluminides for coal gasification systems, 12:36240 (R;US)
Development of the NBS $^{10}Be/^{9}Be$ isotopic standard reference material, 12:37577 (R;US)
Diffraction effects from interfaces, 12:37211 (R;US)
Diffusion theory calculations for the pin-wise power distribution in VENUS-I and VENUS-II, 12:36777 (R;US)
DOE Hazardous Waste Remedial Actions Program: Annual report, FY 1986, 12:36959 (R;US)
Dynamic behavior and control requirements of an atmospheric fluidized-bed coal combustion power plant: A conceptual study, 12:36362 (R;US)
Effect of infiltration conditions on the properties of SiC/Nicalon composites, 12:37301 (R;US)
Effect of temperature on nondissociative electron attachment to molecules, 12:37388 (R;US)
Effects of ozone on forests in the northeastern United States, 12:37605 (R;US)
Electron microscopy of high temperature oxide superconductors, 12:37290 (R;US)
Energy Division annual progress report for period ending September 30, 1986, 12:36750 (R;US)
Environmental Regulatory Update Table, May 1987, 12:36962 (R;US)
Evaluation of a digital optical ionizing radiation particle track detector, 12:37568 (R;US)
Evaluation of gas heating system retrofit pilot programs in Minnesota and Kentucky, 12:37026 (R;US)
Evaluation of gas heating system retrofit pilot programs in Kentucky and Minnesota, 12:37078 (R;US)
Evaluation of power control methods for free-piston Stirling engine driven heat pumps, 12:37025 (R;US)
Evaluation of separation and purification processes in the antibiotic industry, 12:37860 (R;US)
Flaw density examinations of a clad boiling water reactor pressure vessel segment, 12:36773 (R;US)
Geophysical data from boreholes DM1, DM2, DM3, and DM3a, New Hydraulic Fracturing Facility, Oak Ridge National Laboratory, Oak Ridge, Tennessee, 12:36523 (R;US)
Herbaceous Energy Corps Program: Annual progress report for FY 1986, 12:36632 (R;US)
ICRF [ion cyclotron range of frequencies] coupling on DIII-D and the implications on ICRF technology development, 12:38373 (R;US)
Ignition physics study group support of the engineering test reactor program, 12:38375 (R;US)
Ion cyclotron emission calculations using a 2D full wave numerical code, 12:38321 (R;US)
Kinetic theory of radiation effects, 12:37207 (R;US)
Kinetics and mechanisms of creep in hot isostatically pressed niobium carbide, 12:37281 (R;US)
Licensee event report (LER) compilation for month of January 1987, 12:36795 (R;US)
Licensee event report (LER) compilation: For month of April 1987, 12:36797 (R;US)
Licensee event report (LER) compilation for month of February 1987, 12:36796 (R;US)
Magnetization studies of the high T/sub c/ compound $Y_1Ba_2Cu_3O$/sub z/, 12:37294 (R;US)
Materials used in low-level liquid waste reprocessing/treatment studies at Oak Ridge National Laboratory, 12:36502 (R;US)
Modification of tokamak ballooning stability boundaries by alpha populations, 12:38323 (R;US)
New buildup factor data for point kernel calculations, 12:38291 (R;US)
Nonlinear dynamics of tearing modes in the reversed field pinch, 12:38332 (R;US)
Notes on the effect of dose uncertainty, 12:37902 (R;US)
Nuclear medicine progress report for quarter ending December 31, 1986, 12:37878 (R;US)
One and two dimensional radiation analysis of the compact ignition tokamak, 12:38369 (R;US)
Oxidation of Ge-implanted silicon, 12:37332 (R;US)
Pellet injector research at ORNL, 12:38372 (R;US)
Precursors to potential severe core damage accidents: 1984 a status report: Main report and Appendixes A and B, 12:36921 (R;US)
Precursors to potential severe core damage accidents, 1984: A status report: Appendixes C, D, and E, 12:36922 (R;US)
Prediction of the mortality dose-response relationship in man, 12:37901 (R;US)
Preparation of radioactive "mixed" waste samples for measurement of RCRA [Resource Conservation and Recovery Act] organic compounds, 12:37371 (R;US)
Procurement and screening test data for advanced austenitic alloys for 650 degrees C steam service (Part 1, 14Cr-16Ni steels and 20Cr-30Ni-Fe alloys), 12:36755 (R;US)
Production of fine, high-purity, beta SiC powder, 12:37282 (R;US)
Promethium ($Pm^{3+}$) solid state laser, 12:37474 (R;US)
Recent electronic improvements to the Oak Ridge 25URC accelerator, 12:37547 (R;US)
Resistance and resilience of pond and stream ecosystems to toxicant stress: Project summary, 12:37838 (R;US)
Review of the Advanced Toroidal Facility program, 12:38368 (R;US)
Shielding methods for evaluating the versatility of proposed shipping casks, 12:37453 (R;US)
Single-family building retrofit performance monitoring protocol: Data specification guideline, 12:37077 (R;US)
Stopping biological time: The freezing of living cells, 12:37936 (R;US)
Structural information from the selective methylation of acidic O-H and C-H sites in an Argonne premium coal sample, 12:36297 (R;US)
Structural nature of the amorphous-to-crystalline transition in phosphate glasses as studied by liquid chromatography, 12:37331 (R;US)
Subsurface-controlled geological maps for the Y-12 plant and adjacent areas of Bear Creek Valley, 12:38039 (R;US)
Technology development of antennas for ion cyclotron heating experiments in fusion devices, 12:38374 (R;US)
Temporal variation in regulation of production in a pelagic food web model, 12:37833 (R;US)
Testing of developmental ceramic materials in diesel engine combustion chambers, 12:37160 (R;US)
Testing thermal insulations with a thin-heater apparatus, 12:37023 (R;US)
Tests of a high-power folded waveguide coupler for ICRF heating, 12:38371 (R;US)
The determination of chlorophenoxy acid herbicides by liquid chromatography using carbon-14 tracers, 12:37372 (R;US)
The economic feasibility of plastics recycling, 12:37129 (R;US)
The evaporative vector: Homogeneous systems, 12:38094 (R;US)
The ignition physics study group supports the compact ignition tokamak and engineering test reactor programs, 12:38376 (R;US)
The influence of N-ion irradiation on superconducting TiN, 12:37212 (R;US)
The solubilization of low-ranked coals by microorganisms, 12:36295 (R;US)
The strengthening mechanisms in modified AISI 316 stainless steels, 12:37231 (R;US)
Thermal noise in linear passive multiports, 12:37512 (R;US)
Thermolysis of surface-attached 1,3-diphenylpropane: Impact of surface immobilization on thermal reaction mechanisms, 12:36296 (R;US)

**Oak Ridge Y-12 Plant, TN (USA)**
Statistically stable branch method for improving accountability and control, 12:36573 (R;US)

Structure of yeast inorganic pyrophosphastase: A progress report, 12:37861 (R;US)
**Pennsylvania Univ., Philadelphia (USA). Dept. of Physics**
Elastic scattering of muon neutrinos at BNL, 12:38115 (R;US)
**Pittsburgh Univ., PA (USA)**
An experimental study of heat of immersion of coal, 12:36292 (R;US)
Immersion calorimetry of fine coal particles and its relation to flotation, 12:36293 (R;US)
**Pittsburgh Univ., PA (USA). School of Engineering**
Three-dimensional structure of flow in coal-cleaning cyclones: Technical progress report No. 7, March 1, 1987-May 31, 1987, 12:36269 (R;US)
**Planning and Human Systems, Inc., Washington, DC (USA)**
Atomic power in space: A history, 12:36787 (R;US)
**Politechnika Warszawska (Poland)**
Observation of $\pi$/sup 0/$\pi$/sup 0/-interference effect and size of neutral pion emission volume in $\pi$/sup -/Xe-interactions at 3.5 GeV/c, 12:38255 (TG;DE)
**Poly Solar, Inc., Garland, TX (USA)**
Feasibility of using copper indium disulfide for high-efficiency, thin-film solar cells: Final subcontract report, 1 February 1985-30 September 1986, 12:36634 (R;US)
**Pratt and Whitney Aircraft, East Hartford, CT (USA)**
Advanced composite combustor structural concepts program. Final Report, 12:37343 (R;US)
**Price Waterhouse, Pittsburgh, PA (USA)**
Competition: Pressures for change: Final report, 12:36996 (R;US)
**Princeton Univ., NJ (USA). Plasma Physics Lab.**
An algorithm for the calculation of 3-D ICRF [Ion Cyclotron Range of Frequencies] fields in tokamak geometry, 12:38345 (R;US)
Eigenmode analysis of compressional waves in the magnetosphere, 12:38350 (R;US)
Energy confinement and profile consistency in TFTR, 12:38351 (R;US)
Gyrokinetic particle simulation of ion temperature gradient drift instabilities, 12:38353 (R;US)
High-pressure duo-multichannel soft x-ray spectrometer for tokamak plasma diagnostics, 12:38347 (R;US)
Ideal MHD stability properties of pressure-driven modes in low shear tokamaks, 12:38348 (R;US)
Impurity and particle transport and control in TFTR, 12:38382 (R;US)
Ion cyclotron emission calculations using a 2D full wave numerical code, 12:38321 (R;US)
Rigorous upper bounds for transport due to passive advection by inhomogeneous turbulence, 12:38349 (R;US)
Tokamak physics studies using x-ray diagnostic methods, 12:38346 (R;US)
Transport simulations of ohmic TFTR experiments with profile-consistent microinstability-based models for chi/sub e/ and chi/sub i/, 12:38344 (R;US)
Vectorizing and macrotasking Monte Carlo neutral particle algorithms, 12:38352 (R;US)
**Professional Analysis, Inc., Oak Ridge, TN (USA)**
Precursors to potential severe core damage accidents: 1984 a status report: Main report and Appendixes A and B, 12:36921 (R;US)
Precursors to potential severe core damage accidents, 1984: A status report: Appendixes C, D, and E, 12:36922 (R;US)
**Purdue Univ., Lafayette, IN (USA). Water Resources Research Center**
Hydrologic models of surface-mined areas. Technical report, 12:36341 (R;US)

## Q

**Queen Mary Coll., London (UK)**
Mathematical programming studies of short run oil refinery rents, 12:36410 (R;DE)
**Queen Mary Coll., London (UK). School of Mathematics**
Orbit extension method for finding unstable orbits, 12:38333 (R;US)
**Queen's Univ., Kingston, Ontario (Canada). Dept. of Chemistry**
Study of the recombination reaction $CH_3 + CH_3$ yields $C_2H_6$: Theory, 12:37387 (R;US)

## R

**Radian Corp., Austin, TX (USA)**
National Air Toxics Information Clearinghouse (NATICH) data base user's guide for data entry and editing. Interim report, 12:37641 (R;US)
**Radian Corp., Research Triangle Park, NC (USA)**
Characterization of long-term toxic emissions from municipal sludge incineration - project plans and status. Research report 1 May 1986-6 April 1987, 12:37158 (R;US)
Estimating performance/costs of retrofitting control technologies at 12 coal-fired power plants. Report for November 1985-February 1987, 12:36761 (R;US)
**Regis Coll., Weston, MA (USA)**
Magnetosphere-ionosphere interaction studies. Final report, 11 July 1980-30 June 1984, 12:38083 (R;US)
**Rensselaer Polytechnic Inst., Troy, NY (USA)**
Compact reactor studies: Technical progress report, 1 December 1986 through 30 November 1987, 12:38377 (R;US)
**Research Triangle Inst., Research Triangle Park, NC (USA)**
Monitoring before and after radon mitigation, 12:37719 (R;US)
Second performance audit of inspection and maintenance calibration gases, 12:37637 (R;US)
**RE/SPEC, Inc., Albuquerque, NM (USA)**
The SPECTROM-31 Compliant Joint Model: A preliminary description and feasibility study: Nevada Nuclear Waste Storage Investigations project, 12:38046 (R;US)
**RE/SPEC, Inc., Rapid City, SD (USA)**
Mechanical properties and consolidation of potential DHLW [Defense High-Level Wastes] backfill materials: Crushed salt and 70/30 bentonite/sand, 12:36535 (R;US)
**Rice Center, Houston, TX (USA)**
Non-federal funding for transit systems: state-of-the-art case analyses. Final report, 1983-1985, 12:37099 (R;US)
**Rice Univ., Houston, TX (USA). Bonner Nuclear Labs.**
High energy physics: Progress report, 12:38121 (R;US)
**Rochester Univ., NY (USA). Nuclear Structure Research Lab.**
Infiltration at Yucca Mountain, Nevada, traced by $^{36}Cl$, 12:36520 (R;US)
**Rockefeller Univ., New York (USA)**
An experiment to measure the electron neutrino mass using a cryogenic tritium source, 12:38198 (R;US)
[Some basic research problems related to energy: Progress report], 12:38101 (R;US)
**Rock Mechanics Ltd., Falmouth (UK)**
Cleethorpes geothermal exploration borehole. Drilling and testing programme. General report , 12:36722 (R;GB)
**Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant**
Acoustic emission produced by deformation of metals and alloys, 12:37233 (R;US)
Annual Environmental Monitoring report, January through December 1986, 12:37723 (R;US)
Aqueous methods for recovery of plutonium from pyrochemical residues, 12:36490 (R;US)
Design and evaluation of plutonium electrorefining cells, 12:36484 (R;US)
Maintaining occupational review programs using the flow Gemini system, 12:37933 (R;US)
Permeation tubes for dynamic mass spectrometry calibration, 12:37379 (R;US)
[Small scale direct oxide reduction (DOR) experiments], 12:36491 (R;US)
System for removing contaminated surface layers, 12:36807 (TG;US)
Toughness anisotropy and the ductile brittle transition of warm-rolled, hot-rolled, and beta-treated uranium plate, 12:37232 (R;US)
**Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations**
Pretreatment of Hanford PUREX Plant first-cycle waste, 12:36532 (R;US)

**Rockwell International Corp., Thousand Oaks, CA (USA). Science Center**
Transformation toughening of ceramics. Annual report No. 1, 1 September 1985-31 August 1986, 12:37278 (R;US)
**Rogalandsforskning, Stavanger (Norway)**
Biodegradation of oil on cuttings - I, 12:36422 (R;NO)
Oil well drilling, labour practice, safety and environment - low mechanization level, 12:36387 (R;NO;In Norwegian)
**Rolls Royce Motors, Inc., Lyndhurst, NJ (USA)**
Application for certification 1987 model year light-duty vehicles - Rolls Royce, 12:37179 (R;US)
**Rome Univ. (Italy)**
Heat transport and effective Landau Fermi liquid parameters in disordered interacting electronic systems, 12:38219 (R;IT)
**Rowett Research Inst., Aberdeen (UK)**
Report on anaerobic digestion of dairy cattle wastes to October 1981, 12:36585 (R;GB)
**Royal Inst. of Tech., Stockholm (Sweden). Dept. of Chemical Technology**
Peat-bio-gasification. Progress report stage 8 1985-07-01-1986-06-30, 12:36277 (R;SE;In Swedish)

## S

**Sacramento Municipal Utility District, CA (USA)**
SMUDPV2 quarterly performance report IV for the period January through March 1987, 12:36649 (R;US)
**Sandia National Labs., Albuquerque, NM (USA)**
A device to measure friction coefficients and contact resistance inside a scanning Auger microscope, 12:37578 (R;US)
A finite element material model for microfracture-damaged brittle rock, 12:38047 (R;US)
A natural taxonomy for digital information authentication schemes, 12:38399 (R;US)
A new constitutive model for fragmentation of rock under dynamic loading, 12:36467 (R;US)
A performance evaluation of personnel identity verifiers, 12:36567 (R;US)
A strain-rate-dependent spall mechanism transition in metals, 12:37242 (R;US)
Accident Sequence Evaluation Program: Human reliability analysis procedure, 12:36925 (R;US)
An analytical model for Rayleigh-Taylor instability in solids, 12:38301 (R;US)
An experimental and analytical evaluation of a Type B radioactive transport container, 12:37460 (R;US)
Analysis of a proposed NNWSI exploratory shaft slot test for tuff response, 12:36537 (R;US)
Analytic models of nuclide transport in saturated geologic media, 12:36533 (R;US)
Authentication codes that permit arbitration, 12:38398 (R;US)
Base technology development enhances state-of-the-art in meeting performance requirements, 12:37465 (R;US)
Characterization of accelerometer mountings in shock environments, 12:37579 (R;US)
Comparison study of search algorithms and data base libraries for compound identification from mass spectral data, 12:37380 (R;US)
Confined volume blasting experiments: Description and analysis, 12:36466 (R;US)
Coupling boundary integral and finite element formulations for nonlinear halfspace problems, 12:38412 (R;US)
Critical components and monitoring techniques for Nuclear Power Plant life extension, 12:36930 (R;US)
Development of CABAL [calcium-boro-aluminate] glasses for use in lithium ambient-temperature batteries, 12:36945 (R;US)
Dynamic quasi-isentropic compression of tungsten, 12:37241 (R;US)
Electronic structure of boron and boron rich borides, 12:37239 (R;US)
Enclosure environment characterization testing for the base line validation of computer fire simulation codes, 12:36924 (R;US)
Exploratory Battery Technology Development and Testing report for 1985, 12:36944 (R;US)
Flame acceleration in mixtures of hydrogen and air, 12:36579 (R;US)
GaAs/Al/sub 0.3/Ga/sub 0.7/As, heterojunction bipolar transistors for high-temperature (T > 300°C), power electronic applications, 12:37517 (R;US)
Heat transfer to large objects in large pool fires, 12:37464 (R;US)
Insertions using geometric analysis and hybrid force-position control on a PUMA 560 with VAL II, 12:37463 (R;US)
Kevlar/epoxy laminates: Mechanical response of as-fabricated and shock-loaded materials, 12:37350 (R;US)
Liquid metal thermal electric converter, 12:36657 (R;US)
MELCOR validation and verification: 1986 papers, 12:36927 (R;US)
Metastable phase boundaries of quasicrystalline phases, 12:37240 (R;US)
Microscopic origin of the composition-dependent change of the thermal conductivity in boron carbides, 12:37304 (R;US)
Modeling of shock-induced solid state chemistry, 12:38300 (R;US)
Modular array field designs for tracking flat-plate photovoltaic systems: Volume 1, 12:36647 (R;US)
Neutron spectrum adjustment with SANDII using arbitrary trial functions, 12:36800 (R;US)
Nickel site of methane catalysis in the methyl reductase enzyme, 12:36593 (R;US)
On ion induced hard errors in dielectric structures, 12:37516 (R;US)
Progress toward a mercury heat engine: Synthesis of a mercury electrolyte, 12:37008 (R;US)
Quantitative data on the fire behavior of combustible materials found in nuclear power plants: A literature review, 12:36923 (R;US)
Random control at $n^2$ points using n shakers, 12:37508 (R;US)
Reflux heat-pipe solar receiver for a Stirling dish-electric system, 12:36658 (R;US)
Reliable communications in a network with unreliable key distribution centers, 12:36565 (R;US)
Research in lost circulation control for geothermal wells, 12:36726 (R;US)
Robotic handling of spent fuel shipping casks: Preliminary assessment of cask design impacts and technology development needs, 12:37461 (R;US)
RSMASS: A simple model for estimating reactor and shield masses, 12:36789 (R;US)
Safeguards implications related to the use of mixed oxide fuel assemblies in light water reactors, 12:36571 (R;US)
Sandia implementation of the TRACR3D flow and transport code: Nevada Nuclear Waste Storage Investigations Project, 12:37822 (R;US)
Seismic-fragility tests of new and accelerated-aged Class 1E battery cells, 12:36918 (R;US)
Semi-automated reviewing station for IAEA [International Atomic Energy Agency] optical surveillance data, 12:36568 (R;US)
Shock-modified transition metal ferrites, 12:37348 (R;US)
Silicate precursors: chemical kinetics, 12:37407 (R;US)
SIR-1: An autonomous mobile sentry robot, 12:36570 (R;US)
Sliding and thermally induced surface segregation in a gold based precious metal alloy, 12:37238 (R;US)
Small-Scale Seal Performance Test Series "A" thermal/structural data through the 180th day, 12:37347 (R;US)
Strategic Petroleum Reserve (SPR) long-term monitoring system pressure data analyses, 12:36428 (R;US)
Subseabed Disposal Project annual report: Ocean modeling studies, October 1983 through September 1984, 12:36536 (R;US)
Summary of and observations about WIPP [Waste Isolation Pilot Plant] Facility horizon flow measurements through 1986, 12:36540 (R;US)
SUNBURN: A computer code for evaluating the economic viability of hybrid solar central receiver electric power plants, 12:36656 (R;US)
Synthesis, structure and properties of BEDT-TTF derivatives, 12:37408 (R;US)

An experiment to measure the electron neutrino mass using a cryogenic tritium source, 12:38198 (R;US)
**Washington Univ., Seattle (USA)**
Genetics and biochemistry of the Rhizobium meliloti acidic extracellular heteropolysaccharide and its role in nodulation: Annual report for the period 1 June 1986-31 May 1987, 12:36626 (R;US)
**Washington Univ., Seattle (USA). Dept. of Atmospheric Sciences**
Studies of the mechanisms and rates with which nitrogen species are incorporated into cloud water and precipitation (second annual report), 12:37658 (R;US)
**Washington Univ., Seattle (USA). Dept. of Civil Engineering**
Strategies for coping with drought: Part 2, Planning techniques and reliability assessment: Final report, 12:36610 (R;US)
**Washington Univ., Seattle (USA). Dept. of Physics**
Influence of six-quark bags on electron scattering, 12:38268 (R;US)
The EMC effect and related issues, 12:38269 (R;US)
X-ray spectroscopy of solids under pressure: Technical progress report, July 1984-April 1987, 12:37335 (R;US)
**Washington Univ., Seattle (USA). Nuclear Physics Lab.**
Statistical GDR [Giant Dipole Resonances] decay of highly excited states of $^{63}$Cu, 12:38244 (R;US)
**Washington Univ., St. Louis, MO (USA)**
Angular momentum effects in subbarrier fusion, 12:38251 (R;US)
**Washington Univ., St. Louis, MO (USA). McDonnell Center for the Space Sciences**
The early solar system abundance of $^{244}$Pu as inferred from the St. Severin chondrite, 12:38070 (R;US)
**Waterloo Univ., Ontario (Canada)**
An experiment to measure the electron neutrino mass using a cryogenic tritium source, 12:38198 (R;US)
Data collection and performance reporting specifications for solar energy projects: A report of Task VI: The performance of solar heating, cooling, and hot water systems using evacuated collectors, 12:36683 (R;FR)
**Western Research Inst., Laramie, WY (USA)**
Combined gas chromatography/mass spectrometric evaluation of selected isothermally produced shale oils, 12:36475 (R;US)
Evaluation of separate diagnostic correlations for cracking and combustion losses during oil shale retorting, 12:36469 (R;US)
Organic solute profile of water from Rio Blanco Retort 1, 12:36473 (R;US)
Reverse combustion in asphalt ridge tar sand, 12:36468 (R;US)
Separation and detection of ammonia, amines, and alkanolamines with single-column ion chromatography, 12:36474 (R;US)
**Westinghouse Electric Corp., Pittsburgh, PA (USA). Research and Development Center**
Superconducting electronic-film structures. Annual report, 1 January-31 December 1985, 12:37448 (R;US)
Superconducting electronic-film structures. Annual report, 1 January-31 December 1986, 12:37325 (R;US)
**Westinghouse Research and Development Center, Pittsburgh, PA (USA)**
Microstructure, resistivity and the anisotropy of the upper critical field in NbN thin films, 12:37283 (R;US)
Transport critical-current characteristics of $Y_1Ba_2Cu_3O/sub\ x/$, 12:37288 (R;US)
**West Valley Nuclear Services Co., Inc., West Valley, NY (USA)**
Decontamination of the Scrap Removal Room at the West Valley Demonstration Project, 12:36508 (R;US)
STS [supernatant treatment system] confinement barrier integrity review for the West Valley Demonstration Project, 12:36507 (R;US)
Technical and administrative approach for the West Valley Demonstration Project Safety Program, 12:36553 (R;US)
**West Virginia Univ., Morgantown (USA). Dept. of Chemical Engineering**
Kinetic behavior of solid particles in fluidized beds: Solid particle kinetic forces: Progress report for the period October 1-December 31, 1986, 12:36354 (R;US)
**Wisconsin Univ., Madison (USA)**
Physics simulations at high energy, 12:38207 (B;SG)
Progress toward a mercury heat engine: Synthesis of a mercury electrolyte, 12:37008 (R;US)
**Wisconsin Univ., Madison (USA). Solar Energy Lab.**
A modification of the anti $\theta$,f-chart method for solar domestic water heating systems with no mixing, 12:36682 (R;US)
Analysis of the seasonal performance of hybrid desiccant cooling systems, 12:36681 (R;US)
**Wissenschaftszentrum Berlin (Germany, F.R.). Internationales Inst. fuer Umwelt und Gesellschaft**
Energy conservation between environmental policy and consumer policy. Experience from eight countries, 12:37070 (R;DE;In German)
Forestry and forest industries in Liberia. An example in ecological destabilization, 12:37897 (R;DE)
Municipal responses to the energy challenge: Davis, California. Grassroots involvement in energy conservation and planning, 12:36950 (R;DE)
Municipal responses to the energy challenge: Gothenburg and Uppsala, Sweden, 12:36951 (R;DE)
Publications on environmental policy in Japan, 12:36961 (R;DE;In German)

Sunspot numbers: 1610-1985 based on The Sunspot-Activity in the Years 1610-1960', 12:38067 (R;US)
**Wyoming Univ., Laramie (USA). Dept. of Chemical Engineering**
Improved catalysts for coal liquefaction: Quarterly report No. 11 for the period March 1, 1987 to May 31, 1987, 12:36267 (R;US)
Use of basic nitrogen to chemically clean coal: Quarterly report No. 3 for the period March 16, 1987 to June 15, 1987, 12:36238 (R;US)
**Wyoming Univ., Laramie (USA). Office of Univ. Research**
Separation and characterization of coal derived components, 1 April 87-31 June 87, 12:36310 (R;US)

## Y

**Y-ARD Ltd., Glasgow (UK)**
Comparison of mechanical and hydraulic transmission systems for aerogenerators. Volume 1, 12:36744 (R;GB)
Comparison of mechanical and hydraulic transmission systems for aerogenerators. Volume 2, 12:36745 (R;GB)

## Z

**Zaininger Engineering Co., San Jose, CA (USA)**
Electrical behavior of wind power stations: Final report, 12:36646 (R;US)

**Zeopower Co., Natick, MA (USA)**
Closed-cycle desiccant cooling system. Final report, Phases 1 and 2a May 1984-September 1986, 12:37079 (R;US)

# PERSONAL AUTHOR INDEX

Authors' surnames are indexed in the form appearing in the abstracted publication; given names are reduced to initials. Each author entry gives the publication title and the citation number. The document type, e.g., R for Report; country of publication, e.g., US; and language of the document, e.g., In German; are given in parentheses at the end of the entry. If no language statement appears, the language is English. Tables of document types and country of publication codes appear after the indexes. For publications with multiple authors, an entry is provided for each author. Entries for the second and succeeding authors give references to the first author.

Because of problems involved in the mechanical preparation of this index, all accent marks are omitted. Changes in spelling introduced as a result of accent omission follow standard conventions.

# SUBJECT INDEX

The subject index is based on the use of subject descriptors selected from a controlled thesaurus of terms (DOE/TIC-7000). Subject descriptors and qualifiers (subheadings) are selected and presented in the following format:

**SUBJECT DESCRIPTOR**
**Qualifier**
Title, (supplementary information), citation number, (R;US)

The notations in the final parentheses indicate the type of document, e.g., R for Report; the country of publication, e.g., US; and the language if other than English, e.g., In German. Tables of document types and country of publication codes appear after the indexes.

The title may be supplemented with additional words, or a phrase, if it appears additional information would be helpful. In cases for which the title contains little or no information related to the subject entry, it may be replaced entirely by the supplementary information. A qualifier is not always required, and in such cases the title will follow the unqualified subject descriptor.

The descriptors selected for use as subject terms are generally the names of specific materials, things, or processes. To the extent possible, a qualifier is selected to describe the properties of, or processes applied to, the subject term.

Index entries are selected to indicate the important ideas and concepts presented in a document, rather than words that may appear in the text. Within the available thesaurus terms, the most probable or logical place to look for typical information is selected. "See references" are included to guide users from synonymous terms or phrases to the descriptor selected as a subject heading for the concept (e.g., Pipeline Quality Gas, see HIGH BTU GAS). "See also references" are used to indicate where to find references to subject concepts that are narrower, broader, or related to a particular subject heading. To complete an exhaustive search of a given subject, all such headings should be reviewed. Copies of DOE/TIC-7000, the Subject Thesaurus, are available from the National Technical Information Service (NTIS), U.S. Department of Commerce, Springfield, VA 22161.

## A

**A CODES**
Yield optimization of an experimental retort using the ASPEN computer code, 12:36472 (B;US)

**ABIES**
*See FIRS*

**ABNORMALITIES (CHROMOSOMAL)**
*See CHROMOSOMAL ABERRATIONS*

**A-BOMB SURVIVORS**
**Radiation Doses**
Notes on the effect of dose uncertainty, 12:37902 (R;US)

**ABSORBED DOSES**
*See RADIATION DOSES*

**ABSORBERS (SOLAR)**
*See SOLAR ABSORBERS*

**ABSORPTION REFRIGERATION CYCLE**
**Market**
Potential of the tractor-trailer and container segments as entry markets for a proposed refrigeration technology, 12:37103 (R;US)

**ACCELERATOR FACILITIES**
*See also STANFORD LINEAR COLLIDER*
**Design**
Accelerator facilities in the 100-1000 TeV range, 12:37537 (BA;US)
**Planning**
Accelerator facilities in the 100-1000 TeV range, 12:37537 (BA;US)
Conventional 20-TeV, 10-Tesla, p/sup +-/p colliders, 12:37536 (BA;US)

**ACCELEROMETERS**
**Frequency Response Testing**
Characterization of accelerometer mountings in shock environments, 12:37579 (R;US)
**Mechanical Vibrations**
Characterization of accelerometer mountings in shock environments, 12:37579 (R;US)

**ACCESS DENIAL SYSTEMS**
*See ENTRY CONTROL SYSTEMS*

**ACCIDENTAL INTAKE**
*See ACCIDENTS*

**ACCIDENTAL IRRADIATION**
*See RADIATION ACCIDENTS*

**ACCIDENTS**
*See also RADIATION ACCIDENTS*
*REACTOR ACCIDENTS*
**Probability**
Safety and optimal prevention of platform accidents, 12:36413 (R;NO)
**System Failure Analysis**
Using operating experience and a cause coding tree to identify improvements for nuclear process control, 12:36825 (R;US)

**ACCRETION DISKS**
**Mathematical Models**
Collisional dynamics of perturbed particle disks in the solar system. Annual technical progress report, 12:38061 (R;US)

**ACES**
*See QUARKS*

**ACETATES**
**Phosphorescence**
External heavy-atom effect in room-temperature phosphorescence, 12:37382 (J;US)

**ACID CARBONATES**
**Thermodynamic Properties**
Thermodynamics of aqueous mixed potassium carbonate, bicarbonate, and chloride solutions to 368 K, 12:36948 (J;US)

**ACID ELECTROLYTE FUEL CELLS**
**Commercialization**
Status of commercial fuel cell powerplant system development, 12:37012 (R;US)

**ACID RAIN**
Estimating performance/costs of retrofitting control technologies at 12 coal-fired power plants. Report for November 1985-February 1987, 12:36761 (R;US)
Review of the national ambient air-quality standards for particulate matter: updated assessment of scientific and technical information. Addendum to the 1982 OAQPS (Office of Air Quality Planning and Standards) staff paper. Final report, 12:37727 (R;US)
**Atmospheric Chemistry**
Studies of the mechanisms and rates with which nitrogen species are incorporated into cloud water and precipitation (second annual report), 12:37658 (R;US)
**Biological Effects**
Effects of acid precipitation on plant diseases, 12:37999 (R;US)
Effects of acidification on stream ecosystems, 12:37843 (R;US)
**Corrosive Effects**
Effects of sheltering and orientation on the atmospheric corrosion of structural metals, 12:37634 (R;US)
**Environmental Effects**
Characterization of historical growth patterns in declining red spruce trees, 12:37805 (RA;US)

**Inventories**
National Acid Precipitation Assessment Program (NAPAP) Utility Reference File, 1980: Electric Utility Data Base. Data file, 12:36763 (R;US)
National Acid Precipitation Assessment Program (NAPAP) Utility reference file, 1980. Final report, January 1985-October 1986, 12:36764 (R;US)
**Mathematical Models**
Rocky Mountain acid deposition model assessment: review of existing mesoscale models for use in complex terrain, 12:37659 (R;US)
**Surveys**
National Surface Water Survey: Western Lake Survey-Phase 1 (synoptic chemistry) field operations report, 12:37844 (R;US)
**Water Pollution**
National Surface Water Survey: Western Lake Survey-Phase 1 (synoptic chemistry) field operations report, 12:37844 (R;US)
**Water Quality**
RAIN project. Annual report for 1984 (Norway), 12:37622 (R;NO)

**ACRYLONITRILE**
**Air Pollution Control**
Occupational-hazard control options for chemical process unit operations, preliminary survey report for the site visit of October 19, 1981 to Borg-Warner Chemicals Woodmar Plant, Washington, West Virginia, 12:37627 (R;US)

**ACTINIUM 228**
**Radioecological Concentration**
An improved method for the simultaneous determination of $^{224}Ra$, $^{226}Ra$ and $^{228}Ra$ in water, soils and sediments, 12:37848 (R;US)

**ACTIVATED CARBON**
**Sorptive Properties**
Anaerobic fluid-bed treatment of coal conversion wastewater: Third quarterly technical progress report for the period February 16-May 15, 1987, 12:36327 (R;US)

**ACTIVITY TRANSPORT**
*See RADIOACTIVITY TRANSPORT*

**ACTUATORS**
**Design**
The application of variable explosive chamber testing to actuator testing, 12:37583 (R;US)
**Performance Testing**
The application of variable explosive chamber testing to actuator testing, 12:37583 (R;US)

**ADA**
Strategic Defense Initiative ADA (trade name) Process Description Language, Version 1.00. Final report, 12:37186 (R;US)

**ADAPTIVE INTRUSION DATA SYSTEMS**
*See INTRUSION DETECTION SYSTEMS*

**ADENOCARCINOMAS**
*See CARCINOMAS*

**ADENOSINE TRIPHOSPHATE**
*See ATP*

**ADSORBENTS**
*See also ACTIVATED CARBON*
*SILICA GEL*
**Performance Testing**
High-temperature desulfurization of coal gas for gas turbine and fuel cell application, 12:36259 (RA;US)
**Regeneration**
High-temperature desulfurization of coal gas for gas turbine and fuel cell application, 12:36259 (RA;US)

**AEROSOLS**
*See also RADIOACTIVE AEROSOLS*
**Chemical Analysis**
Feasibility of field detection and analysis of the toxic products of combustion, 12:37957 (R;US)
**Diffusion**
Deposition of ultrafine particles on a human nasal cast, 12:37960 (RA;US)
**Dynamics**
Simulation of aerosol dynamics: a comparative review of mathematical models, 12:37643 (R;US)
**Health Hazards**
Health-hazard evaluation report HETA 85-416-1742, Roofing and Waterproofing Sites, Chicago, Illinois, 12:37890 (R;US)
**Indoor Air Pollution**
Health-hazard evaluation report HETA 86-037-1749, Lamiglas, Woodland, Washington, 12:37683 (R;US)
Health-hazard evaluation report HETA 85-306-1753, Timken, Inc., Canton, Ohio, 12:37692 (R;US)
Health-hazard evaluation report HETA 85-018-1759, American Crystal Sugar Company, Moorhead, Minnesota, 12:37695 (R;US)
Health-hazard evaluation report HETA 85-043-1760, American Crystal Sugar Company, Hillsboro, North Dakota, 12:37698 (R;US)
Health-hazard evaluation report HETA 85-044-1761, American Crystal Sugar Company, Drayton, North Dakota, 12:37701 (R;US)
Levels of dusts, bacteria and fungal spores in houses and daycare centers with forced air heating system and at some complain sites, 12:37090 (R;FI;In Finnish)
**Inhalation**
Deposition of ultrafine particles on a human nasal cast, 12:37960 (RA;US)
**Sampling**
Feasibility of field detection and analysis of the toxic products of combustion, 12:37957 (R;US)
Levels of dusts, bacteria and fungal spores in houses and daycare centers with forced air heating system and at some complain sites, 12:37090 (R;FI;In Finnish)

**AGGLOMERATION**
**Comparative Evaluations**
Heavy-liquid cycloning of fine-size coal, 12:36233 (R;US)

**AGGREGATION**
*See AGGLOMERATION*

**AGRICULTURAL RESIDUES**
*See AGRICULTURAL WASTES*

**AGRICULTURAL WASTES**
*See also MANURES*
**Waste Processing**
Algal biomass from farm waste. A pilot plant study, 12:36628 (R;GB)

**AGRICULTURE**
*See also DAIRY INDUSTRY*
**Harvesting**
New machines for handling forest fuels, 12:37150 (R;SE;In Swedish)
**Resource Conservation**
Assessment of selected legal/institutional constraints to water conservation in the western states, 12:36969 (R;US)
**Thermal Waters**
Agricultural utilization of thermal waters - demonstration program. Pt. 2. Detailed scheme of the demonstration program 'Agricultural utilization of geothermal waters in Waltersdorf' and establishment of an individual investigation program. Final report, 12:37144 (R;DE;In German)
**Waste Heat Utilization**
Agricultural utilization of thermal waters - demonstration program. Pt. 2. Detailed scheme of the demonstration program 'Agricultural utilization of geothermal waters in Waltersdorf' and establishment of an individual investigation program. Final report, 12:37144 (R;DE;In German)

**AIR**
**Heating**
Rapid heating of gas/small particle mixture, 12:37410 (J;US)
**Sorptive Properties**
Rapid heating of gas/small particle mixture, 12:37410 (J;US)
**Transfrontier Contamination**
Results of the activity measurements after the reactor accident in Chernobyl, 12:37710 (R;DE;In German)

**AIR CONDITIONERS**
*See also SOLAR AIR CONDITIONERS*
**Energy Efficiency**
Energy efficiency choice in the purchase of residential appliances, 12:37097 (BA;US)
**Field Tests**
Test equipment system to study the dynamics and the controlability of air conditioning processes, 12:37082 (R;FI;In Finnish)

**Market**
Energy efficiency choice in the purchase of residential appliances, 12:37097 (BA;US)
**Thermodynamic Properties**
Test equipment system to study the dynamics and the controlability of air conditioning processes, 12:37082 (R;FI;In Finnish)

**AIR CONDITIONING**
**Air Flow**
Air conditioning at the working positions in an open plan office, 12:37087 (R;FI;In Finnish)
Prerequisities for functioning of the natural ventilation, 12:37093 (R;FI;In Finnish)
**Mathematical Models**
Air conditioning at the working positions in an open plan office, 12:37087 (R;FI;In Finnish)
**Pressure Measurement**
Prerequisities for functioning of the natural ventilation, 12:37093 (R;FI;In Finnish)
**Temperature Control**
Air conditioning at the working positions in an open plan office, 12:37087 (R;FI;In Finnish)
**Thermal Comfort**
Effects of different heating and ventilation systems on employees in relation to symptoms and general comfort in an office building, 12:37083 (R;FI;In Finnish)
**Working Conditions**
Effects of different heating and ventilation systems on employees in relation to symptoms and general comfort in an office building, 12:37083 (R;FI;In Finnish)

**AIR FLOW**
**Thermal Comfort**
Indoor air quality and ventilation requirements, 12:37084 (R;FI;In Finnish)
**Walls**
Prerequisities for functioning of the natural ventilation, 12:37093 (R;FI;In Finnish)
**Windows**
Prerequisities for functioning of the natural ventilation, 12:37093 (R;FI;In Finnish)

**AIR HEATERS**
**Indoor Air Pollution**
Levels of dusts, bacteria and fungal spores in houses and daycare centers with forced air heating system and at some complain sites, 12:37090 (R;FI;In Finnish)

**AIR POLLUTION**
*See also INDOOR AIR POLLUTION*

Air-pollution models as descriptors of cause-effect relationships, 12:37638 (R;US)
Analysis and evaluation of statistical coastal fumigation models, 12:37640 (R;US)
Comparison between four different interregional air pollution models. Appendix 1, 12:37598 (R;DE)
Dispersion in complex terrain: a summary of the AMS (American Meteorological Society) workshop held in Keystone, Colorado, 17-20 May 1983 (journal version), 12:37663 (R;US)
Pollution from motor vehicles and aircraft at Stapleton International Airport (abbreviated report), 12:37599 (R;US)
ROADWAY: a numerical model for predicting air pollutants near highways. User's guide. Final report, 12:37624 (R;US)
Rocky Mountain acid deposition model assessment: review of existing mesoscale models for use in complex terrain, 12:37659 (R;US)
Simulation of aerosol dynamics: a comparative review of mathematical models, 12:37643 (R;US)
Sources and evaluation of uncertainty in long-range transport models, 12:37691 (R;US)
Surrogate-species chemical-reaction mechanism for urban-scale air-quality simulation models. Volume 1. Adaptation of the mechanism. Final report, March 1986-February 1987, 12:37660 (R;US)
Surrogate-species chemical-reaction mechanism for urban-scale air-quality simulation models. Volume 2. Guidelines for using the mechanism. Final report, March 1986-February 1987, 12:37661 (R;US)
**Measuring Methods**
Episodic coincident air-quality and precipitation measurements in an urban setting, 12:37664 (R;US)
Remote measurement of sulfur dioxide emissions using an ultraviolet-light-sensitive video system, 12:37644 (R;US)
**Pollution Regulations**
Handbook for the review of excess emission reports. Final report, 12:37681 (R;US)
**Pollution Sources**
National air-pollutant-emission estimates, 1940-1985. Final report, 12:37666 (R;US)
**Research Programs**
EPA (Environmental Protection Agency) research program guide, FY 1987, October 1, 1986-September 30, 1987, 12:36965 (R;US)
Southern forest growth trends: air pollution influence studies and tree-ring analysis, 12:37943 (RA;US)
Survey to assess the effects of atmospheric deposition on forest vegetation, 12:37783 (RA;DE)

**Soot**
Instrument for the quasi-continuous determination of the atmospheric soot content, 12:37525 (R;DE;In German)
**Standards**
Development of audit devices and materials for source-level air=pollution-measurement methods, 12:37651 (R;US)
**Stationary Pollutant Sources**
Development of audit devices and materials for source-level air=pollution-measurement methods, 12:37651 (R;US)
**Surveys**
National Surface Water Survey: Western Lake Survey-Phase 1 (synoptic chemistry) field operations report, 12:37844 (R;US)

**AIR POLLUTION ABATEMENT**
*Use this term for items that involve the prevention of formation of pollutants at the source.*
Application for certification 1987 model year heavy-duty engines, 12:37168 (R;US)
Application for certification 1987 model year heavy-duty engines - Caterpillar, 12:37169 (R;US)
Application for certification 1987 model year heavy-duty engines - Chrysler, 12:37170 (R;US)
Application for certification 1987 model year heavy-duty engines - Mitsubishi Motors corporation, 12:37171 (R;JP)
Application for certification 1987 model year light-duty vehicles, 12:37172 (R;US)
Application for certification 1987 model year light-duty vehicles - Chrysler, 12:37173 (R;US)
Application for certification 1987 model year light-duty vehicles and light-duty trucks - Ford Motor Company, 12:37174 (R;US)
Application for certification 1987 model year light-duty vehicles - General Motors, 12:37175 (R;US)
Application for certification 1987 model year light-duty vehicles - Mercedes-Benz, 12:37176 (R;US)
Application for certification 1987 model year light-duty vehicles - Nissan, 12:37177 (R;JP)
Application for certification 1987 model year light-duty vehicles - American Motors Corporation (Renault), 12:37178 (R;US)
Application for certification 1987 model year light-duty vehicles - Rolls Royce, 12:37179 (R;US)
Application for certification 1987 model year light-duty vehicles - Volkswagen, 12:37180 (R;US)
Application for certification 1987 model year light-duty vehicles, 12:37181 (R;US)
Application for certification 1987 model year light-duty vehicles - Isuzu, 12:37182 (R;US)
Calcium-based sorbents in the LIMB (Limestone Injection Multistage Burner) process, 12:37670 (R;US)
Estimating performance/costs of retrofitting control technologies at 12 coal-fired power plants. Report for November 1985-February 1987, 12:36761 (R;US)
Gasification of waste as fuel, 12:37705 (R;SE;In Swedish)
National Acid Precipitation Assessment Program (NAPAP) Utility Reference File, 1980: Electric Utility Data Base. Data file, 12:36763 (R;US)
National Acid Precipitation Assessment Program (NAPAP) Utility reference file, 1980. Final report, January 1985-October 1986, 12:36764 (R;US)
Silica-enhanced sorbents for dry-injection removal of $SO_2$ from flue gas. Report for September 1986-March 1987, 12:37669 (R;US)
**Mathematical Models**
Parameter monitoring for real-time electrostatic precipitator trouble shooting. Report for March-August 1985, 12:37652 (R;US)

**AIR POLLUTION CONTROL**
*Use this term for items that involve the removal or management of pollutants after they are formed by a source.*
Combined effects of organic reactivity and NMHC/NOx ratio on photochemical-oxidant formation - a modeling study, 12:37662 (R;US)
National Acid Precipitation Assessment Program (NAPAP) Utility Reference File, 1980: Electric Utility Data Base. Data file, 12:36763 (R;US)
National Acid Precipitation Assessment Program (NAPAP) Utility reference file, 1980. Final report, January 1985-October 1986, 12:36764 (R;US)
**Data Base Management**
National Air Toxics Information Clearinghouse (NATICH) data base user's guide for data entry and editing. Interim report, 12:37641 (R;US)
**Regulations**
NESHAPS (National Emissions Standards for Hazardous Air Pollutants) asbestos demolition and renovation inspection workshop manual. Final report, 12:37726 (R;US)
**Standards**
Review of national emission standards for mercury (final environmental impact statement), 12:37650 (R;US)

**AIR POLLUTION MONITORING**
Transition-flow reactor tube for measuring trace-gas concentrations, 12:37646 (R;US)
**Air Samplers**
Modern continuous samplers for volatile organics and inorganic gases, 12:37665 (R;US)
**Gas Chromatography**
Precolumn sample-enrichment device for analysis of ambient volatile organics by gas chromatography-mass spectrometry, 12:37636 (R;US)
**Manuals**
Handbook for the review of excess emission reports. Final report, 12:37681 (R;US)
**Mass Spectroscopy**
Precolumn sample-enrichment device for analysis of ambient volatile organics by gas chromatography-mass spectrometry, 12:37636 (R;US)

**AIR POLLUTION MONITORS**
Dry deposition of acidic gases and particles. Final report, 12:37667 (R;US)
**Evaluation**
Evaluation of an L-shell X-ray based continuous air monitor for airborne plutonium for use in the waste isolation pilot plant, 12:37716 (RA;US)
**Performance Testing**
Performance of continuous air monitors based on alpha spectroscopy in a dusty environment, 12:37714 (RA;US)
**Quality Assurance**
Development of audit devices and materials for source-level air=pollution-measurement methods, 12:37651 (R;US)

**AIR PREHEATERS**
*See AIR HEATERS*

**AIR QUALITY**
Air-Quality Criteria for Particulate Matter and Sulfur Oxides (1982) (second addendum): assessmet of newly available health-effects information. Final report, 12:37642 (R;US)
Air-quality impact analysis for Easton Utilities Commission Power Plant No. 2, units 23 and 24. Final report, 12:36762 (R;US)
Episodic coincident air-quality and precipitation measurements in an urban setting, 12:37664 (R;US)
Investigation of nitrogen dioxide removal from indoor air. Final report, December 1984-September 1986, 12:37686 (R;US)
**Aerosols**
Levels of dusts, bacteria and fungal spores in houses and daycare centers with forced air heating system and at some complain sites, 12:37090 (R;FI;In Finnish)
**Air Filters**
Indoor particle concentration and the outdoor to indoor transport. Part 4. The human effect on indoor air quality, 12:37092 (R;FI;In Finnish)
Indoor particle concentration and the outdoor to indoor transport, Final report, 12:37094 (R;FI;In Finnish)
**Air Flow**
Indoor particle concentration and the outdoor to indoor transport, Final report, 12:37094 (R;FI;In Finnish)
**Data Analysis**
National air quality and emissions trends report, 1985, 12:37657 (R;US)

**Forecasting**
National air quality and emissions trends report, 1985, 12:37657 (R;US)
**Formaldehyde**
Indoor air quality and ventilation requirements, 12:37084 (R;FI;In Finnish)
**Humidity**
Biological dusts in indoor air and factors affecting the bioaerosol levels, 12:37085 (R;FI;In Finnish)
Indoor air quality in new single family houses at Helsinki and Kuopio regions, 12:37086 (R;FI;In Finnish)
**Particles**
Indoor air quality in new single family houses at Helsinki and Kuopio regions, 12:37086 (R;FI;In Finnish)
Indoor particle concentration and the outdoor to indoor transport. Part 4. The human effect on indoor air quality, 12:37092 (R;FI;In Finnish)
Levels of dusts, bacteria and fungal spores in houses and daycare centers with forced air heating system and at some complain sites, 12:37090 (R;FI;In Finnish)
**Quality Control**
Biological dusts in indoor air and factors affecting the bioaerosol levels, 12:37085 (R;FI;In Finnish)
**Radon**
Indoor air quality and ventilation requirements, 12:37084 (R;FI;In Finnish)
**Recommendations**
Topical report on the meeting of the Gas Research Institute Indoor Air-Quality Research Advisory Committee. Final report, February 11-13, 1986, 12:37682 (R;US)
**Research Programs**
EPA (Environmental Protection Agency) research program guide, FY 1987, October 1, 1986-September 30, 1987, 12:36965 (R;US)
**Standards**
Review of the national ambient air-quality standards for particulate matter: updated assessment of scientific and technical information. Addendum to the 1982 OAQPS (Office of Air Quality Planning and Standards) staff paper. Final report, 12:37727 (R;US)
**Temperature Control**
Indoor air quality in new single family houses at Helsinki and Kuopio regions, 12:37086 (R;FI;In Finnish)
**Tobacco Smokes**
Indoor air quality and ventilation requirements, 12:37084 (R;FI;In Finnish)

**AIR SAMPLERS**
Modern continuous samplers for volatile organics and inorganic gases, 12:37665 (R;US)
**Design**
Design criteria of a virtual impactor, 12:37612 (RA;US)
**Evaluation**
Drag force and slip correction factor of aggregates measured in a Millikan apparatus, 12:37613 (RA;US)
Evaluation of a two-stage virtual impactor as a monodisperse aerosol classifier, 12:36337 (RA;US)
**Humidity**
Indoor air quality in new single family houses at Helsinki and Kuopio regions, 12:37086 (R;FI;In Finnish)
**Particles**
Indoor air quality in new single family houses at Helsinki and Kuopio regions, 12:37086 (R;FI;In Finnish)
**Radon**
Indoor air quality in new single family houses at Helsinki and Kuopio regions, 12:37086 (R;FI;In Finnish)

**AIR SOURCE HEAT PUMPS**
**Energy Consumption**
Heat pump in a block of flats with warm air heating, 12:37095 (R;FI;In Finnish)

**Containment Systems**
Containment and piping research, 12:36890 (RA;US)
Large model tests for containment performance and separate effects tests for penetrations, 12:36916 (RA;US)
Steam explosion energetics, 12:36914 (RA;US)
**Design**
Preliminary conceptual design study for a small LWR: Final report, 12:36772 (R;US)
**ECCS**
Experience with the revised Appendix K, 12:36839 (RA;US)
Regulatory guide in support of ECCS rule revision, 12:36838 (RA;US)
Revision of the ECCS rule, 12:36837 (RA;US)
**Engineered Safety Systems**
Preliminary conceptual design study for a small LWR: Final report, 12:36772 (R;US)
**Lifetime**
Critical components and monitoring techniques for Nuclear Power Plant life extension, 12:36930 (R;US)
**Loss of Coolant**
PKL III small breaks and transients experimental program, 12:36843 (RA;US)
Simulation experiments for hot-leg u-bend two-phase flow phenomena, 12:36855 (RA;US)
**Mixed Oxide Fuels**
Safeguards implications related to the use of mixed oxide fuel assemblies in light water reactors, 12:36571 (R;US)
**Nuclear Data Collections**
Nuclear plant data bank, 12:36870 (RA;US)
**Outages**
Precursors to potential severe core damage accidents, 1984: A status report: Appendixes C, D, and E, 12:36922 (R;US)
**Pipes**
Containment and piping research, 12:36890 (RA;US)
**Reactor Accidents**
Accident Sequence Evaluation Program: Human reliability analysis procedure, 12:36925 (R;US)
Influence of moisture on the behavior of aerosols, 12:36898 (RA;US)
Integrated ex-vessel source term analysis with the CONTAIN 1.1 computer code, 12:36901 (RA;US)
LWR aerosol containment experiments (LACE) program summary and preliminary observations, 12:36899 (RA;US)
MELCOR validation and verification: 1986 papers, 12:36927 (R;US)
QUASAR uncertainty study, 12:36905 (RA;US)
Recent results in hydrogen research, 12:36915 (RA;US)
Steam explosion energetics, 12:36914 (RA;US)
Summary of aerosol code-comparison results for LWR aerosol containment tests LA1, LA2, and LA3, 12:36900 (RA;US)
Thermal-hydraulic studies on molten core-concrete interactions, 12:36903 (RA;US)
**Reactor Components**
Critical components and monitoring techniques for Nuclear Power Plant life extension, 12:36930 (R;US)
US Department of Energy Nuclear Plant Life Extension Program, 12:36929 (R;US)
**Reactor Control Systems**
Critical components and monitoring techniques for Nuclear Power Plant life extension, 12:36930 (R;US)
**Reactor Core Disruption**
Precursors to potential severe core damage accidents: 1984 a status report: Main report and Appendixes A and B, 12:36921 (R;US)
SCDAP/RELAP5 update and applications, 12:36908 (RA;US)
**Reactor Instrumentation**
Degradation of nuclear plant temperature sensors, 12:36774 (R;US)
**Reactor Kinetics**
Three-D neutronics model implementation into TRAC-BD1, 12:36877 (RA;US)
**Reactor Noise**
Comments on remarks on the inadequacy of one-group heterogeneous theories for the interpretation of incore neutron noise in BWRs, 12:36776 (J;GB)
**Reactor Operation**
Licensee event report (LER) compilation: For month of April 1987, 12:36797 (R;US)
Licensee event report (LER) compilation for month of February 1987, 12:36796 (R;US)
Licensee event report (LER) compilation for month of January 1987, 12:36795 (R;US)
Use of probabilistic systems analysis for enhancing plant operational safety and productivity, 12:36891 (RA;US)
**Reactor Operators**
Accident Sequence Evaluation Program: Human reliability analysis procedure, 12:36925 (R;US)
Emergency response training with the BNL plant analyzer, 12:36811 (R;US)

**Reactor Safety**
Analysis of balance-of-plant regulatory issues: Final report, 12:36926 (R;US)
Assessment of uncertainty identification for RELAP5/MOD2 and TRAC-BD1/MOD1 1 codes under core uncovery and reflooding conditions, 12:36885 (RA;US)
BWR plant analyzer development at BNL, 12:36869 (RA;US)
Code uncertainty quantification, 12:36879 (RA;US)
Containment and piping research, 12:36890 (RA;US)
CSNI validation matrix for PWR and BWR codes, 12:36873 (RA;US)
Dryout front modeling for rod bundles, 12:36852 (RA;US)
Experience with the revised Appendix K, 12:36839 (RA;US)
Large model tests for containment performance and separate effects tests for penetrations, 12:36916 (RA;US)
Nuclear plant analyzer development at the Idaho National Engineering Laboratory, 12:36868 (RA;US)
Nuclear plant data bank, 12:36870 (RA;US)
Nuclear safety—forward on technology and backward on perception, 12:36889 (RA;US)
PKL III small breaks and transients experimental program, 12:36843 (RA;US)
Precursors to potential severe core damage accidents, 1984: A status report: Appendixes C, D, and E, 12:36922 (R;US)
Regulatory guide in support of ECCS rule revision, 12:36838 (RA;US)
Revision of the ECCS rule, 12:36837 (RA;US)
Sandia code accuracy quantification and its application to TRAC-PF1/MOD1 assessment, 12:36880 (RA;US)
SCDAP/RELAP5 update and applications, 12:36908 (RA;US)
Simulation experiments for hot-leg u-bend two-phase flow phenomena, 12:36855 (RA;US)
Status of integral facilities and future plans for integral testing, 12:36840 (RA;US)
Status of the TRAC-BWR Program, 12:36865 (RA;US)
STCP validation, 12:36909 (RA;US)
Steam separator modeling for various nuclear reactor accidents, 12:36853 (RA;US)
Three-D neutronics model implementation into TRAC-BD1, 12:36877 (RA;US)
TRAC code development status and plans, 12:36867 (RA;US)
TRAC development at General Electric, 12:36876 (RA;US)
US Department of Energy Nuclear Plant Life Extension Program, 12:36929 (R;US)
Validation of TRAC-PD2 against experiment LP-02-6 of the OECD-LOFT series, 12:36878 (RA;US)
**Reactor Shutdown**
Analysis of balance-of-plant regulatory issues: Final report, 12:36926 (R;US)
**Reactor Simulators**
Emergency response training with the BNL plant analyzer, 12:36811 (R;US)
**Reliability**

**CATALYST SUPPORTS**
**Research Programs**
Properties of lanthanide oxides as supports for transition metal catalysts: Progress report for the period May 1, 1986 to April 30, 1987, 12:37333 (R;US)

**CATALYSTS**
Solid state, surface and catalytic properties of oxides: Final report, 12:37392 (R;US)
**Catalyst Supports**
Improved Fischer-Tropsch synthesis catalysts for indirect coal liquefaction: Quarterly technical progress report No. 5 for the period 1 October to 31 December 1986, 12:36583 (R;US)
**Chemical Composition**
Activation and promotion studies in a mixed slurry reactor with an iron-manganese Fischer-Tropsch catalyst, 12:37412 (J;US)
**Chemical Preparation**
Development and process evaluation of improved Fischer-Tropsch slurry catalysts: Quarterly technical progress report for the period 17 October 1986 to 31 January 1987, 12:36582 (R;US)
Improved Fischer-Tropsch synthesis catalysts for indirect coal liquefaction: Quarterly technical progress report No. 5 for the period 1 October to 31 December 1986, 12:36583 (R;US)
Improved Fischer-Tropsch synthesis catalysts for indirect coal liquefaction: Quarterly technical progress report No. 6 for the period 1 January to 31 March 1987, 12:36584 (R;US)
Slurry-phase Fischer-Tropsch synthesis, 12:36581 (R;US)
Surface chemistry of model Co-Mo catalysts supported on planar g-Al/sub 2/O/sub 3/: Quarterly technical progress report for period March 1, 1987 to May 31, 1987, 12:36268 (R;US)
The study of some transition metals complexes as process catalysts: Quarterly report for the period March 1, 1987 through May 31, 1987, 12:36265 (R;US)
Trifunctional catalysts for conversion of syngas to alcohols: Eleventh quarterly report for period March 1, 1987 to May 31, 1987, 12:36597 (R;US)
**Comparative Evaluations**
Catalytic coprocessing: Effect of catalyst type and sequencing, 12:36281 (J;US)
Development and process evaluation of improved Fischer-Tropsch slurry catalysts: Quarterly technical progress report for the period 17 October 1986 to 31 January 1987, 12:36582 (R;US)
Improved catalysts for coal liquefaction: Quarterly report No. 11 for the period March 1, 1987 to May 31, 1987, 12:36267 (R;US)
**Deactivation**
Improved catalysts for coal liquefaction: Quarterly report No. 11 for the period March 1, 1987 to May 31, 1987, 12:36267 (R;US)
**Electron Spin Resonance**
Trifunctional catalysts for conversion of syngas to alcohols: Eleventh quarterly report for period March 1, 1987 to May 31, 1987, 12:36597 (R;US)
**Microstructure**
Effect of pore-distributed coke on catalyst regeneration kinetics, 12:36284 (B;US)
**Performance Testing**
Development and process evaluation of improved Fischer-Tropsch slurry catalysts: Quarterly technical progress report for the period 17 October 1986 to 31 January 1987, 12:36582 (R;US)
Improved Fischer-Tropsch synthesis catalysts for indirect coal liquefaction: Quarterly technical progress report No. 5 for the period 1 October to 31 December 1986, 12:36583 (R;US)
Improved Fischer-Tropsch synthesis catalysts for indirect coal liquefaction: Quarterly technical progress report No. 6 for the period 1 January to 31 March 1987, 12:36584 (R;US)
Slurry-phase Fischer-Tropsch synthesis, 12:36581 (R;US)

The study of some transition metals complexes as process catalysts: Quarterly report for the period March 1, 1987 through May 31, 1987, 12:36265 (R;US)
The testing of catalysts for alkane activation, 12:36600 (R;US)
**Photoelectron Spectroscopy**
Trifunctional catalysts for conversion of syngas to alcohols: Eleventh quarterly report for period March 1, 1987 to May 31, 1987, 12:36597 (R;US)
**Poisoning**
Peat-bio-gasification. Progress report stage 8 1985-07-01-1986-06-30, 12:36277 (R;SE;In Swedish)
**Porosity**
Effect of pore-distributed coke on catalyst regeneration kinetics, 12:36284 (B;US)
**Regeneration**
Effect of pore-distributed coke on catalyst regeneration kinetics, 12:36284 (B;US)
**Sorptive Properties**
Surface chemistry of model Co-Mo catalysts supported on planar g-Al/sub 2/O/sub 3/: Quarterly technical progress report for period March 1, 1987 to May 31, 1987, 12:36268 (R;US)

**Activation Analysis**
Use of generator produced neutrons in coal analysis: Quarterly report, December 16, 1985-March 15, 1986 (Around a borehole), 12:36313 (R;US)
Use of generator produced neutrons in coal analysis: Quarterly report, March 15, 1986-June 15, 1986 (Around a borehole), 12:36314 (R;US)
Use of generator produced neutrons in coal analysis: Quarterly report, September 16, 1986-December 15, 1986, 12:36312 (R;US)
**Ashes**
A program of basic research on the preparation and stability of coal/water slurries: Final report, 12:36360 (R;US)
**Bioconversion**
Biodegradation and bioconversion of coals by fungi: Technical report No. 7 for the period March 1, 1987-May 31, 1987, 12:36315 (R;US)
The solubilization of low-ranked coals by microorganisms, 12:36295 (R;US)

**Biodegradation**
Biodegradation and bioconversion of coals by fungi: Technical report No. 7 for the period March 1, 1987-May 31, 1987, 12:36315 (R;US)
**Boilers**
European activities in $SO_2$ and NOx emission control. Report for April 1986-March 1987, 12:36332 (R;US)
**Chemical Reactions**
Catalyst accessibility in high volatile bituminous coal: Quarterly report, 12:36316 (R;US)
**Cleaning**
America's clean coal commitment, 12:36235 (R;US)
Comprehensive report to Congress Clean Coal Technology Program: Enhancing the use of coals by gas reburning and sorbent injection, 12:36326 (R;US)
Three-dimensional structure of flow in coal-cleaning cyclones: Technical progress report No. 7, March 1, 1987-May 31, 1987, 12:36269 (R;US)
**Coking**
Effect of pore-distributed coke on catalyst regeneration kinetics, 12:36284 (B;US)
Modelling of chamber coking as a reaction determined by heat transport, 12:36274 (R;DE;In German)
**Combustion**
Effect of coal cleaning on the combustion environment-materials interaction, 12:36232 (R;US)
Trace metal removal from combustion gases, 12:36335 (R;FI;In Finnish)
**Combustion Kinetics**
Laser-induced fluorescence detection of mineral vaporization species, 12:36358 (RA;US)
**Combustion Products**
Characterization of advanced sorbents for dry $SO_2$ control. Published paper, October 1984-March 1987, 12:36331 (R;US)
Effective mixing processes for SOx, sorbent, and coal-combustion products. Final report, October 1984-July 1986, 12:36765 (R;US)
FGD (flue-gas desulfurization), SCR (selective-catalytic-reduction) gain: coal-fired-boiler experience in Japan, 12:36334 (R;US)
**Comminution**
Coal cleaning employing quaternary salts: Annual report, March 1, 1986-February 28, 1987, 12:36239 (R;US)
**Computerized Tomography**
X-ray Computed Tomography of coal: Final report, 12:36299 (R;US)
**Crushing**
An automated microscopic method for the determination of pyrite size distributions in crushed coal, 12:36298 (R;US)
**Deashing**
Autogenous process for low-ash and low-sulfur coal production: Technical progress report, April 1, 1987-June 30, 1987, 12:36237 (R;US)
Fine grinding and flotation to desulfurize coal, 12:36228 (R;US)
Technical/economic analyses of mine-to-market scenarios involving varying levels of coal preparation and coal water slurry production using a computerized coal evaluation model: Final report, 12:36364 (R;US)
TRW Gravimelt Process for desulfurization and demineralization of coal, 12:36286 (B;US)
**Demineralization**
TRW Gravimelt Process for desulfurization and demineralization of coal, 12:36286 (B;US)
**Derivatization**
Electrochemical characterization and derivatization of coal: Technical progress report, March 15, 1987-June 15, 1987, 12:36319 (R;US)
**Desulfurization**
Autogenous process for low-ash and low-sulfur coal production: Technical progress report, April 1, 1987-June 30, 1987, 12:36237 (R;US)
Coal cleaning employing quaternary salts: Annual report, March 1, 1986-February 28, 1987, 12:36239 (R;US)
Fine grinding and flotation to desulfurize coal, 12:36228 (R;US)
Technical/economic analyses of mine-to-market scenarios involving varying levels of coal preparation and coal water slurry production using a computerized coal evaluation model: Final report, 12:36364 (R;US)
TRW Gravimelt Process for desulfurization and demineralization of coal, 12:36286 (B;US)
Use of basic nitrogen to chemically clean coal: Quarterly report No. 3 for the period March 16, 1987 to June 15, 1987, 12:36238 (R;US)
**Electrolysis**
Electrochemical characterization and derivatization of coal: Technical progress report, March 15, 1987-June 15, 1987, 12:36319 (R;US)
**Electron Spin Resonance**
Catalyst accessibility in high volatile bituminous coal: Quarterly report, 12:36316 (R;US)
**Electrophoresis**
A program of basic research on the preparation and stability of coal/water slurries: Final report, 12:36360 (R;US)
**Evaluation**
Technical/economic analyses of mine-to-market scenarios involving varying levels of coal preparation and coal water slurry production using a computerized coal evaluation model: Final report, 12:36364 (R;US)
**Flotation**
Immersion calorimetry of fine coal particles and its relation to flotation, 12:36293 (R;US)
**Flow Models**
Pneumatic transport of coal by steam, 12:36350 (B;US)
**Fluidized-Bed Combustion**
Erosion calculations in a two-dimensional fluidized bed, 12:36352 (R;US)
Materials for FBC [fluidized-bed combustion] air heater applications, 12:36351 (R;US)
**Forecasting**
Documentation of the integrating module and stock module of the intermediate future forecasting system, 12:36949 (R;US)
**Fuel Slurries**
Char-oil-water slurry study. Final report, 25 November 1985-28 February 1987, 12:36349 (R;US)
**Gravimelt Process**
TRW Gravimelt Process for desulfurization and demineralization of coal, 12:36286 (B;US)
**Hydraulic Transport**
Pneumatic transport of coal by steam, 12:36350 (B;US)
Two-channel gamma-ray method applied to three-component analyses in hydraulic transport systems, 12:37563 (R;DE)
**Hydrogenation**
Catalytic coprocessing: Effect of catalyst type and sequencing, 12:36281 (J;US)
Exploitation of asphalts by hydrogenation in extreme conditions using introduced catalysts. Final report, 12:36276 (R;XE;In French)
Low severity coal conversion by ionic hydrogenation: [Progress report], April 1 to June 30, 1987, 12:36270 (R;US)
**Market**
Documentation of the integrating module and stock module of the intermediate future forecasting system, 12:36949 (R;US)
**Mathematical Models**
Characterization of pore structure changes during gasification, 12:36288 (B;US)
**Methylation**
Structural information from the selective methylation of acidic O-H and C-H sites in an Argonne premium coal sample, 12:36297 (R;US)
**Molecular Structure**
Host/guest structure concept and the thermolysis of coal, 12:36324 (BA;NL)
Oxidation and coal structure, 12:36322 (BA;NL)
**Oxidation**
Oxidation and coal structure, 12:36322 (BA;NL)
Surface chemical problems in coal flotation, 12:36234 (R;US)
Surface properties of coal and their role in coal beneficiation: Technical progress report, 16 March 1987-15 June 1987, 12:36318 (R;US)

The solubilization of low-ranked coals by microorganisms, 12:36295 (R;US)

**Particle Size**
A program of basic research on the preparation and stability of coal/water slurries: Final report, 12:36360 (R;US)
In-situ particle characterization, 12:36307 (RA;US)

**Pneumatic Transport**
Reduction of erosion in elbows due to flow field modifications, 12:36347 (RA;US)

**Pyrolysis**
Host/guest structure concept and the thermolysis of coal, 12:36324 (BA;NL)
Modelling of chamber coking as a reaction determined by heat transport, 12:36274 (R;DE;In German)
Thermolysis of surface-attached 1,3-diphenylpropane: Impact of surface immobilization on thermal reaction mechanisms, 12:36296 (R;US)

**Radioactivity**
Radioactivity in coal, ashes and selected wastewaters from Canadian coal-fired steam electric generating stations, 12:37849 (R;CA)

**Slurry Pipelines**
Characterization, renovation, and utilization of water from slurry-transport systems, 12:36348 (R;US)

**Solids Flow**
Advanced research in instrumentation and control technology: capacitance flowmeter, 12:36243 (RA;US)

**Structural Chemical Analysis**
Characterization of pore structure changes during gasification, 12:36288 (B;US)
Structural information from the selective methylation of acidic O-H and C-H sites in an Argonne premium coal sample, 12:36297 (R;US)

**Supply and Demand**
Documentation of the integrating module and stock module of the intermediate future forecasting system, 12:36949 (R;US)
Documentation of the resource allocation and mine costing (RAMC) model: Methodology description, 12:36984 (R;US)

**Surface Area**
A program of basic research on the preparation and stability of coal/water slurries: Final report, 12:36360 (R;US)

**Swelling**
Coal cleaning employing quaternary salts: Annual report, March 1, 1986-February 28, 1987, 12:36239 (R;US)

**Washing**
Technical/economic analyses of mine-to-market scenarios involving varying levels of coal preparation and coal water slurry production using a computerized coal evaluation model: Final report, 12:36364 (R;US)

**Wettability**
A program of basic research on the preparation and stability of coal/water slurries: Final report, 12:36360 (R;US)
Surface properties of coal and their role in coal beneficiation: Technical progress report, 16 March 1987-15 June 1987, 12:36318 (R;US)

**Wetting Heat**
An experimental study of heat of immersion of coal, 12:36292 (R;US)
Immersion calorimetry of fine coal particles and its relation to flotation, 12:36293 (R;US)

**X-Ray Diffraction**
Characterization of pore structure changes during gasification, 12:36288 (B;US)

**COAL CHEMICALS**
*See COAL EXTRACTS*

**COAL EXTRACTS**
**Electron Spin Resonance**
Temperature dependence of the electron spin resonance spectra of a coal-derived vacuum distillation residue and components, 12:36320 (J;US)

**COAL FINES**
**Pelletizing**
A humic acid binder for pelletizing of fine coal, 12:36230 (R;US)

**COAL GAS**
**Chemical Analysis**
Advanced coherent Raman diagnostics for coal gasification streams, 12:36304 (RA;US)
Design and calibration of Morgantown Energy Technology Center's alkali fiber optic spectrometer, 12:36309 (RA;US)
Laser-based infrared spectroscopy for trace analysis of process streams, 12:36303 (RA;US)

**Cleaning**
High-temperature control of contaminants in coal-derived gases, 12:36283 (BA;US)

**Combustion Kinetics**
Deposition effects in pressurized combustion of coal-derived fuels, 12:36357 (RA;US)

**Desulfurization**
High-temperature desulfurization of coal gas for gas turbine and fuel cell application, 12:36259 (RA;US)

**Hot Gas Cleanup**
Applications of separations technology for the control of pollutants in advanced coal combustion systems, 12:36336 (BA;US)

**Monitoring**
Application of atomic absorption to on-stream monitoring of molecules and atoms in gas streams, 12:36308 (RA;US)
Optical detection of alkali compounds, 12:36302 (RA;US)

**Multi-Element Analysis**
Development of inductively coupled plasma spectroscopy for on-line analysis, 12:36300 (RA;US)

**Toxicity**
Coal conversion (liquefaction/gasification): Engineering considerations and relationships among physical, chemical and toxicological properties of resulting materials, 12:36367 (BA;US)

**COAL GASIFICATION**
*See also TOSCOAL PROCESS*
Characterization, renovation, and utilization of water from slurry-transport systems, 12:36348 (R;US)
Trace metal removal from combustion gases, 12:36335 (R;FI;In Finnish)

**Chemical Reaction Kinetics**
Characterization of pore structure changes during gasification, 12:36288 (B;US)
Coal conversion (liquefaction/gasification): Engineering considerations and relationships among physical, chemical and toxicological properties of resulting materials, 12:36367 (BA;US)
Micropore diffusion in coal chars under reactive conditions: Quarterly technical progress report, 15 December 1986-15 March 1987 (Effect of activated diffusion in small pores), 12:36271 (R;US)
SNG from coal is a viable and required future energy supply option, 12:36285 (BA;US)

**Measuring Instruments**
Opening remarks: instrumentation, components, and materials contractors meeting, 12:36242 (RA;US)

**Toscoal Process**
Control-technology assessment for coal gasification and liquefaction processes, 12:36275 (R;US)

**COAL GASIFICATION PLANTS**
**Computerized Control Systems**
Process control methodologies for advanced fossil energy process research, 12:36258 (RA;US)

**Corrosion Resistant Alloys**
Development of iron aluminides for gasification systems, 12:36251 (RA;US)

**Data Acquisition Systems**
Process control methodologies for advanced fossil energy process research, 12:36258 (RA;US)

**Flow Regulators**
Alternative flow control nozzles: energy dissipation of highly erosive fluids, 12:36247 (RA;US)

**Flowmeters**
Advanced research in instrumentation and control technology: capacitance flowmeter, 12:36243 (RA;US)

**Materials Testing**
Development of iron aluminides for coal gasification systems, 12:36240 (R;US)
**Pressure Regulators**
Fluid friction control valve, 12:36248 (RA;US)
**Pressure Vessels**
Reduced girth seam weldments for heavy-walled vessels, 12:36249 (RA;US)
**Seals**
High-temperature rotating shaft seal, 12:36253 (RA;US)
**Technology Assessment**
Gasification island concept systems, 12:36257 (RA;US)
**Valves**
Coal slurry letdown device, 12:36255 (RA;US)
**Waste Water**
Anaerobic fluid-bed treatment of coal conversion wastewater: Third quarterly technical progress report for the period February 16-May 15, 1987, 12:36327 (R;US)

COAL LIQUEFACTION
*See also H-COAL PROCESS*
*TSL PROCESS*
**Catalysts**
A two-stage bench scale catalytic reactor system, 12:36290 (B;US)
Coal liquefaction using transition metal carbonyl catalysts, 12:36262 (RA;US)
Disposable catalysts in coal liquefaction, 12:36282 (BA;NL)
Improved catalysts for coal liquefaction: Quarterly report No. 11 for the period March 1, 1987 to May 31, 1987, 12:36267 (R;US)
Low severity coal liquefaction using homogeneous basic nitrogen catalysts: Technical progress report, February-April 1987, 12:36272 (R;US)
Strong acids as catalysts for the direct liquefaction of coal (Superacids), 12:36263 (RA;US)
The study of some transition metals complexes as process catalysts: Quarterly report for the period March 1, 1987 through May 31, 1987, 12:36265 (R;US)
**Chemical Reaction Kinetics**
Coal conversion (liquefaction/gasification): Engineering considerations and relationships among physical, chemical and toxicological properties of resulting materials, 12:36367 (BA;US)
**Chemical Reactors**
A two-stage bench scale catalytic reactor system, 12:36290 (B;US)
**Fuel Oils**
Char-oil-water slurry study. Final report, 25 November 1985-28 February 1987, 12:36349 (R;US)
**Hydrogen Transfer**
Disposable catalysts in coal liquefaction, 12:36282 (BA;NL)
Transition metal catalysis of hydrogen shuttling in coal liquefaction: Quarterly technical progress report, 9/1/86-11/30/86, 12:36266 (R;US)
**Synthetic Petroleum**
Exploitation of asphalts by hydrogenation in extreme conditions using introduced catalysts. Final report, 12:36276 (R;XE;In French)
**Yields**
Coal liquefaction with liquid clathrates, 12:36264 (RA;US)

COAL LIQUEFACTION PLANTS
**Chemical Reactors**
Vacuum still bottoms viscometer, 12:36289 (B;US)
**Flow Regulators**
Alternative flow control nozzles: energy dissipation of highly erosive fluids, 12:36247 (RA;US)
**Fouling**
Vacuum still bottoms viscometer, 12:36289 (B;US)
**Pressure Regulators**
Fluid friction control valve, 12:36248 (RA;US)
**Valves**
Coal slurry letdown device, 12:36255 (RA;US)
Slurry valve development, 12:36246 (RA;US)
**Viscosimeters**
Vacuum still bottoms viscometer, 12:36289 (B;US)

COAL LIQUIDS
**Catalytic Cracking**
Effect of phosphorus on the activity of Ni-Mo/alumina coal-liquid upgrading catalysts, 12:36279 (J;US)
**Chemical Analysis**
Development and evaluation of supercritical fluid chromatography/mass spectrometry for polar and high molecular weight coal components, 12:36301 (RA;US)
**Deashing**
Integrated two-stage liquefaction of subbituminous coal: The Advanced Coal Liquefaction R and D Facility, Wilsonville, Alabama: Final report, 12:36273 (R;US)
**Electron Spin Resonance**
Temperature dependence of the electron spin resonance spectra of a coal-derived vacuum distillation residue and components, 12:36320 (J;US)
**Fractionation**
Separation and characterization of coal derived components, 1 April 87-31 June 87, 12:36310 (R;US)
**Hydrogenation**
Improved catalysts for coal liquefaction: Quarterly report No. 11 for the period March 1, 1987 to May 31, 1987, 12:36267 (R;US)
Integrated two-stage liquefaction of subbituminous coal: The Advanced Coal Liquefaction R and D Facility, Wilsonville, Alabama: Final report, 12:36273 (R;US)
Surface chemistry of model Co-Mo catalysts supported on planar g-Al/sub 2/O/sub 3/: Quarterly technical progress report for period March 1, 1987 to May 31, 1987, 12:36268 (R;US)
**Mass Spectroscopy**
Separation and characterization of coal derived components, 1 April 87-31 June 87, 12:36310 (R;US)
**Mixing Heat**
Thermodynamics of molecular interactions in coal liquids: Progress report for the period July-December 1986, 12:36260 (R;US)
**Recycling**
Integrated two-stage liquefaction of subbituminous coal: The Advanced Coal Liquefaction R and D Facility, Wilsonville, Alabama: Final report, 12:36273 (R;US)
**Structural Chemical Analysis**
Separation and characterization of coal derived components, 1 April 87-31 June 87, 12:36310 (R;US)
**Thermodynamic Properties**
Thermodynamics of molecular interactions in coal liquids: Progress report for the period July-December 1986, 12:36260 (R;US)
**Toxicity**
Coal conversion (liquefaction/gasification): Engineering considerations and relationships among physical, chemical and toxicological properties of resulting materials, 12:36367 (BA;US)

COAL MINES
**Feasibility Studies**
Preliminary feasibility study of a coal mine at Chicago Creek, Alaska. Summary report. Report of investigations, 12:36365 (R;US)
**Fires**
Wood crib fires in a ventilated tunnel. Report of Investigations/1986, 12:36366 (R;US)
**On-Site Power Generation**
Preliminary feasibility study of a coal mine at Chicago Creek, Alaska. Summary report. Report of investigations, 12:36365 (R;US)
**Underground Mining**
Evaluating ventilation parameters of three coal-mine gobs. Information circular/1986, 12:36342 (R;US)

COAL MINING
**Geologic Structures**
Thick-seam mining in the Western United States--geological considerations. Information Circular/1986, 12:36343 (R;US)
**Surface Mining**
Hydrologic models of surface-mined areas. Technical report, 12:36341 (R;US)

**COAL PREPARATION**
*See also HEAVY MEDIA SEPARATION*
**Economics**
Technical/economic analyses of mine-to-market scenarios involving varying levels of coal preparation and coal water slurry production using a computerized coal evaluation model: Final report, 12:36364 (R;US)
**Feasibility Studies**
Coal cleaning employing quaternary salts: Annual report, March 1, 1986-February 28, 1987, 12:36239 (R;US)
**Flotation**
Autogenous process for low-ash and low-sulfur coal production: Technical progress report, April 1, 1987-June 30, 1987, 12:36237 (R;US)
Development and demonstration of a static tube flotation system for producing superclean coal: Technical progress report, 7th quarterly ending 6/30/87, 12:36236 (R;US)
Fine grinding and flotation to desulfurize coal, 12:36228 (R;US)
Surface chemical problems in coal flotation, 12:36234 (R;US)
**Grinding**
Development and demonstration of a static tube flotation system for producing superclean coal: Technical progress report, 7th quarterly ending 6/30/87, 12:36236 (R;US)
Fine grinding and flotation to desulfurize coal, 12:36228 (R;US)
**Research Programs**
FY 86 in-house coal preparation research at DOE's Pittsburgh Energy Technology Center, 12:36231 (R;US)
**Reviews**
Sulfur reduction from coal through physical beneficiation, 12:36229 (R;US)
**Technology Assessment**
Applications of separations technology for the control of pollutants in advanced coal combustion systems, 12:36336 (BA;US)
**COAL PREPARATION PLANTS**
**Flowsheets**
Development and demonstration of a static tube flotation system for producing superclean coal: Technical progress report, 7th quarterly ending 6/30/87, 12:36236 (R;US)
Sulfur reduction from coal through physical beneficiation, 12:36229 (R;US)
**COAL RESERVES**
**Sulfur Content**
Sulfur reduction from coal through physical beneficiation, 12:36229 (R;US)
**COAL SEAMS**
**Degassing**
An analysis of the coal and coalbed methane resources of the Piceance Basin, Colorado, 12:36447 (BA;US)
Application of horizontal drainhole drilling technology for coalbed methane recovery, 12:36452 (BA;US)
Source rock evaluation: A method of predicting dominant reservoir mechanisms of deeply buried, low-permeability coal reservoirs, 12:36446 (BA;US)
The influence of reservoir properties and geologic setting on coalbed fracturing and production: A preliminary evaluation of the TEAM project, 12:36444 (BA;US)
The use of simulation and history matching to determine critical coalbed methane reservoir properties, 12:36445 (BA;US)
**Fracturing**
The use of simulation and history matching to determine critical coalbed methane reservoir properties, 12:36445 (BA;US)
**Gas Saturation**
An analysis of the coal and coalbed methane resources of the Piceance Basin, Colorado, 12:36447 (BA;US)
**Injection Wells**
Application of horizontal drainhole drilling technology for coalbed methane recovery, 12:36452 (BA;US)
**Mathematical Models**
The use of simulation and history matching to determine critical coalbed methane reservoir properties, 12:36445 (BA;US)
**Permeability**
The use of simulation and history matching to determine critical coalbed methane reservoir properties, 12:36445 (BA;US)
**Porosity**
The use of simulation and history matching to determine critical coalbed methane reservoir properties, 12:36445 (BA;US)
**COAL TAR**
**Aerosols**
Health-hazard evaluation report HETA 85-416-1742, Roofing and Waterproofing Sites, Chicago, Illinois, 12:37890 (R;US)

**Corrosion**
An assessment of performance of materials for FBC [fluidized-bed combustion] air heater applications, 12:37208 (R;US)
**Erosion**
An assessment of performance of materials for FBC [fluidized-bed combustion] air heater applications, 12:37208 (R;US)
**COBALT COMPLEXES**
**Crystal Structure**
The spectroscopy and structure of novel high energy-high density compounds: Final progress report, May 1, 1985-July 31, 1986, 12:37391 (R;US)
**Nitration**
The spectroscopy and structure of novel high energy-high density compounds: Final progress report, May 1, 1985-July 31, 1986, 12:37391 (R;US)

**COBALT COMPOUNDS**
**Reduction**
Properties of lanthanide oxides as supports for transition metal catalysts: Progress report for the period May 1, 1986 to April 30, 1987, 12:37333 (R;US)
**Shock Waves**
Shock-modified transition metal ferrites, 12:37348 (R;US)
**COGENERATION**
*Prior to November 1980, this concept was indexed to CO-GENERATION.*
*See COGENERATION*
Follow-on 40-kW test support program: 40-kW fuel-cell field-test data analysis. Final report, April 1980-December 1986, 12:37013 (R;US)
Slow speed coal/water slurry fired diesels in industrial cogeneration: Market evaluation, 12:37135 (R;US)
**Load Management**
Optimized load distribution in supply systems with combined heat and power generation in consideration of the district heating network, 12:37146 (R;DE;In German)
**Optimization**
Optimized load distribution in supply systems with combined heat and power generation in consideration of the district heating network, 12:37146 (R;DE;In German)
**COHERENT ANTI-STOKES RAMAN SPECTROSCOPY**
*See RAMAN SPECTROSCOPY*
**COKE**
**Chemical Reaction Kinetics**
Effect of pore-distributed coke on catalyst regeneration kinetics, 12:36284 (B;US)
**COKE OVENS**
**Temperature Distribution**
Modelling of chamber coking as a reaction determined by heat transport, 12:36274 (R;DE;In German)
**COKE-OVEN GAS**
*See COAL GAS*
**COKING**
**Catalysts**
Effect of pore-distributed coke on catalyst regeneration kinetics, 12:36284 (B;US)
**Diagnostic Techniques**
Evaluation of separate diagnostic correlations for cracking and combustion losses during oil shale retorting, 12:36469 (R;US)
**Heat Transfer**
Modelling of chamber coking as a reaction determined by heat transport, 12:36274 (R;DE;In German)
**Mathematical Models**
Modelling of chamber coking as a reaction determined by heat transport, 12:36274 (R;DE;In German)
**COKING PLANTS**
**Hazardous Materials**
Health-hazard evaluation report HETA 85-441-1765, New Boston Coke Corporation, New Boston, Ohio, 12:36291 (R;US)
**COLD PLASMA**
**Electric Fields**
Limits on the cross-field propagation of streams of cold plasma, 12:38360 (J;US)
**Stopping Power**
Limits on the cross-field propagation of streams of cold plasma, 12:38360 (J;US)
**COLLAGEN**
**Biosynthesis**
Changes in collagen and DNA from nickel subsulfide-injured pulmonary alveolar macrophages cultured with lung fibroblasts, 12:37971 (RA;US)
**COLLEGES**
*See EDUCATIONAL FACILITIES*
**COLLIDING BEAMS**
**Beam-Beam Interactions**
Beamstrahlung from colliding electron-positron beams with negligible disruption, 12:37545 (J;NL)
**COLLIERIES**
*See COAL MINES*
**COLLISIONAL PLASMA**
**ECR Heating**
Effect of trapped electrons on current drive, 12:38358 (J;US)
**Lower Hybrid Heating**
Effect of trapped electrons on current drive, 12:38358 (J;US)
**Trapped-Particle Instability**
Effect of trapped electrons on current drive, 12:38358 (J;US)
**COLLISIONLESS PLASMA**
**Plasma Instability**
Electron heating by ion acoustic turbulence in simulated low Mach number shocks, 12:38364 (J;US)
**Shock Waves**
Electron heating by ion acoustic turbulence in simulated low Mach number shocks, 12:38364 (J;US)
**Turbulence**
Electron heating by ion acoustic turbulence in simulated low Mach number shocks, 12:38364 (J;US)
**COLLISIONS**
*For low-energy interactions involving photons, electrons, ions, atoms, and molecules; not for NUCLEAR REACTIONS; for elementary particles and radiations see also INTERACTIONS.*
**Absorption Spectra**
Master-equation approach to collisionally induced absorption and emission, 12:38093 (R;US)
**Photon Emission**
Master-equation approach to collisionally induced absorption and emission, 12:38093 (R;US)
**COLLODION**

*IN-SITU COMBUSTION*
*REVERSE COMBUSTION*

**Air Pollution**
Trace metal removal from combustion gases, 12:36335 (R;FI;In Finnish)
**Diagnostic Techniques**
Evaluation of separate diagnostic correlations for cracking and combustion losses during oil shale retorting, 12:36469 (R;US)
**Mathematical Models**
Calculation of radiation spectrum of non-isothermal gas, 12:37444 (R;FI;In Finnish)

**COMBUSTION CHAMBERS**
**Composite Materials**
Advanced composite combustor structural concepts program. Final Report, 12:37343 (R;US)
**Gases**
Calculation of radiation spectrum of non-isothermal gas, 12:37444 (R;FI;In Finnish)
**Temperature Control**
Calculation of radiation spectrum of non-isothermal gas, 12:37444 (R;FI;In Finnish)
**Turbulent Flow**
Prediction of recirculation zones in isothermal coaxial jet flows relevant to combustors, 12:37494 (R;US)

**COMBUSTION KINETICS**
**Mathematical Models**
Remarks on the stability analysis of reactive flows, 12:37442 (R;US)

**COMBUSTION PRODUCTS**
**Air Pollution**
Sulfur dioxide emissions from oil refineries and combustion of oil products in western europe (1985), 12:37647 (R;NL)
Trace metal removal from combustion gases, 12:36335 (R;FI;In Finnish)
**Air Pollution Abatement**
Effective mixing processes for SOx, sorbent, and coal-combustion products. Final report, October 1984-July 1986, 12:36765 (R;US)
**Dusts**
Health-hazard evaluation report HETA 86-477-1755, Cumberland County Homemaker Home Health Aid Service, Bridgeton, New Jersey, 12:37700 (R;US)
**Exhaust Gases**
Comparative potency of complex mixtures: use of short-term genetic bioassays in cancer risk assessment, 12:38003 (R;US)
**Flue Gas**
Characterization of advanced sorbents for dry $SO_2$ control. Published paper, October 1984-March 1987, 12:36331 (R;US)
Environmental assessment of a wood-waste-fired industrial watertube boiler. Volume 1. Technical results. Final report, March 1981-March 1984, 12:36606 (R;US)
Environmental assessment of a wood-waste-fired industrial watertube boiler. Volume 2. Data supplement. Final report, March 1981-March 1984, 12:36607 (R;US)
European activities in $SO_2$ and NOx emission control. Report for April 1986-March 1987, 12:36332 (R;US)
FGD (flue-gas desulfurization), SCR (selective-catalytic-reduction) gain: coal-fired-boiler experience in Japan, 12:36334 (R;US)
**Gas Chromatography**
Feasibility of field detection and analysis of the toxic products of combustion, 12:37957 (R;US)
**Hydrochloric Acid**
Improvements in the methodology for measuring hydrochloric acid in combustion source emissions, 12:36333 (R;US)
**Materials Recovery**
Characterization of long-term toxic emissions from municipal sludge incineration - project plans and status. Research report 1 May 1986-6 April 1987, 12:37158 (R;US)
**Particulates**
Particle evolution in MHD systems, 12:37005 (R;US)
**Recovery**
Continuous thermodynamics for phase equilibria and enthalpy calculations. Annual report, September 1, 1985-December 31, 1986, 12:36464 (R;US)
**Toxic Materials**
Characterization of long-term toxic emissions from municipal sludge incineration - project plans and status. Research report 1 May 1986-6 April 1987, 12:37158 (R;US)

**COMBUSTORS**

Exploratory Battery Technology Development and Testing report for 1985, 12:36944 (R;US)
**Sealing Materials**
Development of CABAL [calcium-boro-aluminate] glasses for use in lithium ambient-temperature batteries, 12:36945 (R;US)
**Seismic Effects**
Seismic-fragility tests of new and accelerated-aged Class 1E battery cells, 12:36918 (R;US)
**ELECTRIC CABLES**
**Dielectric Properties**
Impact of steep front, short duration impulses on power system apparatus and insulation: A critical review, 12:36771 (BA;US)
**Electromagnetic Pulses**
Impact of steep front, short duration impulses on power system apparatus and insulation: A critical review, 12:36771 (BA;US)
**Failure Mode Analysis**
Impact of steep front, short duration impulses on power system apparatus and insulation: A critical review, 12:36771 (BA;US)
**ELECTRIC CONDENSERS**
*See CAPACITORS*
**ELECTRIC CONDUCTIVITY**
*See also SUPERCONDUCTIVITY*
**Correlations**
Quantitative microstructural effects on the conductivity of composites, 12:37298 (R;DE;In German)
**ELECTRIC CONTACTS**
**Electrical Properties**
Structure and electrical properties of metal contacts on GaAs, 12:37254 (J;US)

**ELECTRIC FILTERS**
**Testing**
The Thermal Flash Protection System, low pass filter JN175666A1, 12:37515 (R;US)
**ELECTRIC GENERATORS**
*Rotating generators only; excludes DIRECT ENERGY CONVERTERS.*
*See also INDUCTION GENERATORS*
**Computerized Simulation**
Improvement in accuracy of prediction of electrical machine constants and generator models for subsynchronous resonance conditions: Volume 3, Development and benefit assessment of finite-element-based saturation model: Final report, 12:36753 (R;US)
**Hydraulic Equipment**
Comparison of mechanical and hydraulic transmission systems for aerogenerators. Volume 1, 12:36744 (R;GB)
**Mechanical Transmissions**
Comparison of mechanical and hydraulic transmission systems for aerogenerators. Volume 1, 12:36744 (R;GB)
**ELECTRIC HEATING**
**Air Quality**
Impact of electric space-heating on comfort of living. Literature study, 12:37071 (R;FI;In Finnish)
**Thermal Comfort**
Impact of electric space-heating on comfort of living. Literature study, 12:37071 (R;FI;In Finnish)
**ELECTRIC MOTORS**
**Performance Testing**
Improved motors for utility applications: Volume 5, Motor-winding impulse capability: Final report, 12:36754 (R;US)
**ELECTRIC POWER**
*See also HYDROELECTRIC POWER*
**Economic Analysis**
Analysis of market shares for gas and electricity: indicative costs and benefits of gas reticulation, 12:36954 (R;US)
**Energy Consumption**
Trends in consumption and expenditures, 1978-1984: Residential Energy Consumption Survey, 12:37002 (R;US)
**Energy Expenses**
Trends in consumption and expenditures, 1978-1984: Residential Energy Consumption Survey, 12:37002 (R;US)
**Forecasting**
Documentation of the integrating module and stock module of the intermediate future forecasting system, 12:36949 (R;US)
**Market**
Documentation of the integrating module and stock module of the intermediate future forecasting system, 12:36949 (R;US)
**Marketing**
Proceedings: 1986 Electric Utility Market Research symposium, 12:36995 (R;US)
**Research Programs**
Interagency advanced power group project briefs by field of interest and a subject index: Semiannual Compilation, February 1987, 12:37000 (R;US)
**Supply and Demand**
Documentation of the integrating module and stock module of the intermediate future forecasting system, 12:36949 (R;US)
**ELECTRIC POWER INDUSTRY**
**Competition**
Competition: Pressures for change: Final report, 12:36996 (R;US)
**Planning**
Competition: Pressures for change: Final report, 12:36996 (R;US)
**ELECTRIC POWER RESEARCH INSTITUTE**
*See EPRI*
**ELECTRIC POWER SYSTEMS**
*See POWER SYSTEMS*
**ELECTRIC RESISTIVITY**
*See ELECTRIC CONDUCTIVITY*
**ELECTRIC UTILITIES**
**Acid Rain**
National Acid Precipitation Assessment Program (NAPAP) Utility Reference File, 1980: Electric Utility Data Base. Data file, 12:36763 (R;US)
National Acid Precipitation Assessment Program (NAPAP) Utility reference file, 1980. Final report, January 1985-October 1986, 12:36764 (R;US)
**Economic Analysis**
Effect of conservation programmes on electric utility earnings: results of two case studies, 12:37001 (J;GB)
**Energy Conservation**
Effect of conservation programmes on electric utility earnings: results of two case studies, 12:37001 (J;GB)
**Planning**
Ninth EPRI Member Utility Survey results, 12:36997 (R;US)
**Rate Structure**
The death spiral: An assessment of its likelihood in electric utilities, 12:36993 (R;US)
**Surveys**
Ninth EPRI Member Utility Survey results, 12:36997 (R;US)
**ELECTRICAL CONDUCTIVITY**
*See ELECTRIC CONDUCTIVITY*
**ELECTRICAL INSULATION**
**Physical Radiation Effects**
Field dependence of geminate recombination in a dielectric medium. Final report, October 1974-September 1975, 12:37280 (R;US)
**ELECTRICAL INSULATORS**
**Dielectric Properties**
Impact of steep front, short duration impulses on power system apparatus and insulation: A critical review, 12:36771 (BA;US)
**Electromagnetic Pulses**
Impact of steep front, short duration impulses on power system apparatus and insulation: A critical review, 12:36771 (BA;US)
**Energy Losses**
Energy dissipation in the scanning tunneling microscopy of metals and insulators, 12:37276 (BA;US)
**Failure Mode Analysis**
Impact of steep front, short duration impulses on power system apparatus and insulation: A critical review, 12:36771 (BA;US)
**Tunnel Effect**
Tunneling from a self-energy approach, 12:37277 (BA;US)
**ELECTRICAL RESISTANCE**
*See ELECTRIC CONDUCTIVITY*
**ELECTRICAL RESISTIVITY**
*See ELECTRIC CONDUCTIVITY*
**ELECTRIC-POWERED VEHICLES**
**Electric Batteries**
Batteries for hybrid vehicles or other high-power applications, 12:36947 (J;GB)
Zinc-bromine battery development, 12:36946 (R;US)
**ELECTROCHEMICAL CELLS**
*See also ELECTRIC BATTERIES*
*FUEL CELLS*
*PHOTOELECTROCHEMICAL CELLS*
**Control Systems**
Corrosion in district heating systems. Development of an electrochemical corrosion measuring cell, 12:37156 (R;DK;In Danish)
**Performance**
Thermodynamics of aqueous mixed potassium carbonate, bicarbonate, and chloride solutions to 368 K, 12:36948 (J;US)
**Thermodynamics**
Thermodynamics of aqueous mixed potassium carbonate, bicarbonate, and chloride solutions to 368 K, 12:36948 (J;US)
**ELECTROCHROMISM**
**Research Programs**
Recent results: SERI's development of advanced glazings, 12:37054 (RA;US)
**ELECTRODES**
**Fabrication**
Materials development for solid oxide oxygen production unit, 12:37293 (R;US)
**Geometry**
Particle compaction with alternating electric fields: The effects of electrode geometry, 12:37428 (BA;US)

**Materials**
Materials development for solid oxide oxygen production unit, 12:37293 (R;US)
**ELECTROLYSIS**
**Parametric Analysis**
Electrochemical characterization and derivatization of coal: Technical progress report, March 15, 1987-June 15, 1987, 12:36319 (R;US)
**ELECTROLYTES**
**Electric Impedance**
Impedance and electroreflectance of reduced poly (3-methyl thiophene)-P3MT in an aqueous electrolyte: Direct observation of a polaron transition, 12:36642 (J;US)
**Fabrication**
Materials development for solid oxide oxygen production unit, 12:37293 (R;US)
**Materials**
Materials development for solid oxide oxygen production unit, 12:37293 (R;US)
**Reflectivity**
Impedance and electroreflectance of reduced poly (3-methyl thiophene)-P3MT in an aqueous electrolyte: Direct observation of a polaron transition, 12:36642 (J;US)
**ELECTROLYTIC CELLS**
Thermoelectric conversion with ion conductors. Quarterly technical progress report No. 2, 1 November 1986-15 January 1987, 12:37007 (R;US)
**Electric Potential**
Absolute half-cell potential: A simple direct measurement, 12:37431 (J;US)
**Membranes**
Optimisation of a membrane cell cascade for chlorine alkali electrolysis under the aspect of energy consumption, 12:37405 (R;DE;In German)
**Performance Testing**
Pilot scale (100 kW) water electrolysis plant based on inorganic-membrane-electrolyte technology. Final report, 12:36575 (R;DE)
**Pilot Plants**
Pilot scale (100 kW) water electrolysis plant based on inorganic-membrane-electrolyte technology. Final report, 12:36575 (R;DE)
**ELECTROMAGNETIC FIELDS**
**Computerized Simulation**
Computation of fields and signals due to ferromagnetic anomalies, 12:37268 (BA;US)
**ELECTROMAGNETISM**
NRL (Naval Research Laboratory) plasma formulary, (revised), 12:38098 (R;US)
**ELECTRON ANTINEUTRINOS**
**Mass**
The Los Alamos free atomic tritium beta decay experiment, 12:38236 (BA;US)
**Rest Mass**
Limit on the anti $\nu$ mass in free molecular tritium beta decay, 12:38152 (BA;DE)
**ELECTRON BEAMS**
NRL (Naval Research Laboratory) plasma formulary, (revised), 12:38098 (R;US)
**Beam Currents**
Free-electron laser success explained, 12:37492 (J;US)
**Brightness**
Free-electron laser success explained, 12:37492 (J;US)
**Spin Orientation**
Measurement of electron beam polarization at the SLC, 12:37564 (R;US)
**ELECTRON CYCLOTRON-RESONANCE HEATING**
*See ECR HEATING*
**ELECTRON MICROSCOPES**
**Friction**
A device to measure friction coefficients and contact resistance inside a scanning Auger microscope, 12:37578 (R;US)
**ELECTRON MICROSCOPY**
*See also TRANSMISSION ELECTRON MICROSCOPY*
**Diffraction**
Diffraction effects from interfaces, 12:37211 (R;US)
**ELECTRON NEUTRINOS**
*See also ELECTRON ANTINEUTRINOS*
**Mass**
An experiment to measure the electron neutrino mass using a cryogenic tritium source, 12:38198 (R;US)
Can the neutrino mass be measured using /sup 163/Ho electron capture, 12:38259 (BA;US)
**Neutrino Oscillation**
Comparison of narrow-band and wide-band neutrino beams in the search for $\nu$/sub $\mu$/$\rightarrow\nu$/sub e/ oscillations, 12:38150 (J;US)
**ELECTRON PAIRS**
**Pair Production**
Calculation of pair production by 10 and 20 MeV photons, 12:38275 (J;US)
**ELECTRON REACTIONS**
**Deep Inelastic Scattering**
CEBAF [Continuous Electron Beam Accelerator Facility] scientific program, 12:38230 (R;US)
Parity violation workshop: CEBAF [Continuous Electron Beam Accelerator Facility], 12:38272 (R;US)
**Elastic Scattering**
Parity violation workshop: CEBAF [Continuous Electron Beam Accelerator Facility], 12:38272 (R;US)
**Historical Aspects**
35 years of electron scattering, 12:38271 (R;US)
**Inelastic Scattering**
Electroexcitation of discrete levels in /sup 12/C and /sup 13/C at high momentum transfers, 12:38240 (J;US)
Semi-inclusive inelastic electron scattering from nuclei, 12:38265 (R;US)
**P Invariance**
Parity violation workshop: CEBAF [Continuous Electron Beam Accelerator Facility], 12:38272 (R;US)
**Particle Production**
Recent axion searches, 12:38142 (RA;US)
**Quark Model**
Influence of six-quark bags on electron scattering, 12:38268 (R;US)
**ELECTRONIC CIRCUITS**
**Design**
Some applications of phasor measurements to adaptive protection, 12:37511 (R;US)
**Temperature Noise**
Thermal noise in linear passive multiports, 12:37512 (R;US)
**ELECTRONIC EQUIPMENT**
*See also MICROWAVE EQUIPMENT*
*POWER SUPPLIES*
**Superconducting Junctions**
SIS (superconductor-insulator-superconductor) mixer research. Final report, 15 November 1985-14 November 1986, 12:37452 (R;US)
**ELECTRONICS (QUANTUM)**
*See QUANTUM ELECTRONICS*
**ELECTRON-NUCLEON INTERACTIONS**
**Degrees of Freedom**
Spin degrees of freedom in electron nucleon scattering in the resonance region, 12:38124 (R;US)
**Resonance Scattering**
Spin degrees of freedom in electron nucleon scattering in the resonance region, 12:38124 (R;US)
**ELECTRON-POSITRON INTERACTIONS**
Future frontiers for $e^+e^-$ collisions: physics of SLC and LEP, 12:38145 (R;US)
**Annihilation**
$E^+e^-\rightarrow W^+W^-$ in $E_6$ models with additional neutral gauge bosons, 12:38199 (J;US)
Excited lepton search, 12:38116 (R;DE)
Radiative tau pair production and search for new particles decaying into tau, 12:38117 (R;DE)
**Inelastic Scattering**
Excited lepton search, 12:38116 (R;DE)
**Multiple Production**
Comparison of multihadronic event generators, 12:38186 (RA;US)
Physics from PEP, 12:38134 (RA;US)

Results from PETRA, 12:38135 (RA;US)
**Pair Production**
Leptonic polarization asymmetries at $e^+e^-$ colliders in $E_6$ theories, 12:38164 (R;US)
Recent results on upsilon physics from CUSB-II, 12:38137 (RA;US)
Status of Monte Carlos for a tau pair production at SLC, 12:38170 (RA;US)
**Particle Production**
Bound on the number of neutrinos from $e^+e^- \rightarrow \gamma$ upsilon anti upsilon at PEP and PETRA, 12:38128 (RA;US)
Counting neutrinos at SLC, 12:38189 (RA;US)
Finding open top, 12:38176 (RA;US)
Forward-backward asymmetry for b and c quarks, 12:38172 (RA;US)
Granlibakken meeting: b and c quark summary, 12:38187 (RA;US)
Higgs boson production at the $Z^0$ and the possibilities of vertex detectors, 12:38183 (RA;US)
J/psi spectroscopy from MARK III, 12:38139 (RA;US)
Monte Carlo models for top production, 12:38175 (RA;US)
New stable charged particles, 12:38181 (RA;US)
Physics from $Z^0$ measurements: mass, width, and total cross section, 12:38166 (RA;US)
Physics from PEP, 12:38134 (RA;US)
Recent results from ARGUS, 12:38136 (RA;US)
Recent results on upsilon physics from CUSB-II, 12:38137 (RA;US)
Recent results from the crystal ball experiment, 12:38138 (RA;US)
Reconstructing heavy long-lived neutral leptons, 12:38180 (RA;US)
Renormalization of electroweak interactions and the BREMMUS Monte Carlo simulator, 12:38167 (RA;US)
Renormalization group improved Yennie-Frautschi-Suura Theory and Monte Carlo event generators, 12:38169 (RA;US)
Report on electroweak parameters, 12:38171 (RA;US)
Results from PETRA, 12:38135 (RA;US)
Search for new interactions via lepton flavor violation at or beyond the $Z^0$ pole., 12:38174 (RA;US)
Small visible energy events and close-mass lepton pairs, 12:38178 (RA;US)
Status report on the polarization facility at the SLC, 12:38173 (RA;US)
Study of $D^+ \rightarrow K^-\pi^+\pi^+$ selection using the vertex drift chamber, 12:38188 (RA;US)
Study of QED radiative corrections at the Z, 12:38168 (RA;US)
Summary of work on $Z^0 \rightarrow$ Higgs neutrinos antineutrinos, 12:38182 (RA;US)
Summary of work on $Z^0 \rightarrow$ Higgs anti ff, 12:38184 (RA;US)
Summary of work on QCD backgrounds to $Z^0 \rightarrow H^0$ anti ell ell, 12:38185 (RA;US)
Supersymmetric particle searches, 12:38177 (RA;US)
Toponium physics with a small data sample, 12:38179 (RA;US)
Toponium-$Z^0$ mixing, 12:38192 (RA;US)

Biomedical and Environmental Sciences Programs: Publications 1986, 12:37859 (R;US)
**Management**
Executive summary of long-range environmental management plans: FY 1987-1993, 12:36960 (R;US)
**Pollution Regulations**
Environmental Regulatory Update Table, May 1987, 12:36962 (R;US)
**Variations**
Disaggregation of tree-ring series for environmental studies, 12:37758 (RA;US)
Trade-offs between the use of tree-ring counting and dendrochronology in ecological studies, 12:37762 (RA;US)
**ENVIRONMENTAL ENGINEERING**
Reference guide for building diagnostics equipment and techniques. Final report, August 1982-July 1986, 12:37015 (R;US)
**ENVIRONMENTAL PARKS**
*See NATURE RESERVES*
**ENVIRONMENTAL POLICY**
**Bibliographies**
Publications on environmental policy in Japan, 12:36961 (R;DE;In German)
**Compliance**
Environmental Regulatory Update Table, May 1987, 12:36962 (R;US)
**Recommendations**
Environmental Regulatory Update Table, May 1987, 12:36962 (R;US)
**ENVIRONMENTAL PROTECTION AGENCY**
*See US EPA*
**ENVIRONMENTAL QUALITY**
*See also AIR QUALITY*
*WATER QUALITY*
**Bibliographies**
EPA (Environmental Protection Agency) Publications Bibliography. Quarterly abstract bulletin. Quarterly report, 12:36968 (R;US)
**Indicators**
Environmental indicators: a comparison of international trends, 12:37857 (R;IT;In Italian)
**ENVIRONMENTAL TEMPERATURE**
*See AMBIENT TEMPERATURE*
**ENVIRONMENTAL TRANSPORT**
*See also RADIONUCLIDE MIGRATION*
**Mathematical Models**
Comparison between four different interregional air pollution models. Appendix 1, 12:37598 (R;DE)
Transport of organic contaminants in coastal plain sediments, 12:37808 (R;US)
**ENZYMES**
*The enzyme code numbers from ENZYME NOMENCLATURE: RECOMMENDATIONS (1972) OF THE INTERNATIONAL UNION OF PURE AND APPLIED CHEMISTRY AND THE INTERNATIONAL UNION OF BIOCHEMISTRY is given in a Scope Note for the individual enzymes.*
*See also DNA HELICASES*
*HYDROLASES*
*LIGASES*
*OXIDOREDUCTASES*
*TRANSFERASES*
**Crystal Structure**
Structure of yeast inorganic pyrophosphastase: A progress report, 12:37861 (R;US)
**EOR**
*See ENHANCED RECOVERY*
**EPA**
*See US EPA*
**EPITHELIUM**
**DNA Replication**
Effect of irradiation on unscheduled DNA synthesis induced by 4-nitroquinoline in tracheal epithelium of rats, 12:37929 (RA;US)
**Inflammation**
Acute effects of neutrophils on nasal epithelial mucosubstances: quantitative histochemistry, 12:37984 (RA;US)
**EPOXIDES**
**Aerosols**
Health-hazard evaluation report HETA 86-037-1749, Lamiglas, Woodland, Washington, 12:37683 (R;US)
**Mechanical Properties**
Mechanical and thermal characterization of unidirectional aramid/epoxy. Final report, November 1985-December 1986, 12:37329 (R;US)
**Tensile Properties**
Baseline tensile tests of composite materials for LDEF (Long duration exposure facility) exposure, 12:37342 (R;US)
**EPOXY COMPOUNDS**
*See EPOXIDES*
**EPRI**
**Research Programs**
Nuclear safety—forward on technology and backward on perception, 12:36889 (RA;US)
**ERBIUM 149**
**Energy Levels**
Observation of /sup 149/Tm decay to /sup 149/Er levels and $\beta$-delayed proton emission, 12:38253 (J;US)
**ESCHERICHIA COLI**
**Genetic Engineering**
Isolation and genetic analysis of mutations allowing the degradation of furans and thiophenes by Escherichia coli, 12:37870 (J;US)

**Genetic Mapping**
Isolation and genetic analysis of mutations allowing the degradation of furans and thiophenes by Escherichia coli, 12:37870 (J;US)

**ESTERS**
*Includes esters of organic and inorganic acids.*
**Chemical Preparation**
A molecular building-block approach to the synthesis of ceramic materials, 12:37319 (BA;US)
**Structural Chemical Analysis**
A molecular building-block approach to the synthesis of ceramic materials, 12:37319 (BA;US)

**ESTUARIES**
**Turbidity**
Suspended fine cohesive sediment in the Severn Estuary and inner Bristol Channel, UK , 12:36733 (R;GB)
**United Kingdom**
Suspended fine cohesive sediment in the Severn Estuary and inner Bristol Channel, UK , 12:36733 (R;GB)

**ESTUARINE ECOSYSTEMS**
*See AQUATIC ECOSYSTEMS*

**ETA MESONS**
**Particle Production**
J/psi spectroscopy from MARK III, 12:38139 (RA;US)
Results from PETRA, 12:38135 (RA;US)
**Radiative Decay**
Recent results from the crystal ball experiment, 12:38138 (RA;US)

**ETA-549**
*See ETA MESONS*

**ETHANE**
**Chemical Reaction Yield**
Study of the recombination reaction $CH_3 + CH_3$ yields $C_2H_6$: Theory, 12:37387 (R;US)
**Fischer-Tropsch Synthesis**
Rate and selectivity modification in Fischer-Tropsch synthesis over charcoal supported molybdenum by forced concentration cycling, 12:36595 (B;US)
**Ion-Molecule Collisions**
The free-radical and ion chemistry of volatile silanes, germanes and phosphines: Annual informal technical report, November 1, 1986-May 31, 1987, 12:37432 (R;US)

**1,2-ETHANEDIOL**
*See GLYCOLS*

**ETHANOL**
**Biosynthesis**
SERI Biochemical Conversion Program: 1985 annual report, 12:36601 (R;US)
Utilization of solid matter and the saving of energy within the sphere of the sugar industry by means of the biotechnical use of extracted cossettes - Phase 2. Final report, 12:36596 (R;DE;In German)
**Nuclear Magnetic Resonance**
Two dimensional NMR of liquids and oriented molecules, 12:37401 (R;US)
**Production**
Controlling of processes for producing energy carriers by means of biotechnique, 12:36602 (R;SE;In Swedish)
SERI Biochemical Conversion Program: 1985 annual report, 12:36601 (R;US)
**Yields**
Physiological adaptations of anaerobic bacteria to low pH: metabolic control of proton motive force in Sarcina ventriculi, 12:36604 (J;US)

**ETHANOL FUELS**
*Use for pure ethanol, ethanol-water mixtures, or ethanol with additives; for ethanol-gasoline mixtures, use GASOHOL.*
**Economics**
Ethanol production from agricultural raw materials, 12:36992 (R;IT;In Italian)
**Marketing Research**
Ethanol production from agricultural raw materials, 12:36992 (R;IT;In Italian)

**ETHNIC GROUPS**
*See MINORITY GROUPS*

**ETHOCEL**
*See CELLULOSE*

**ETHYL ALCOHOL**
*See ETHANOL*

**ETHYLENE**
**Hydrogenation**
Trifunctional catalysts for conversion of syngas to alcohols: Eleventh quarterly report for period March 1, 1987 to May 31, 1987, 12:36597 (R;US)

**ETHYLENE GLYCOL**
*See GLYCOLS*

**ETHYLENE POLYMERS**
*See POLYETHYLENES*

**ETR REACTOR**
*EGandG Idaho, Inc., Idaho Falls, Idaho*
**Research Programs**
Ignition physics study group support of the engineering test reactor program, 12:38375 (R;US)

**EUPHORBIA**
**Cultivation**
Quality and quantity of latex which can be produced from natural vegetation in Greece, 12:36630 (R;FR)

**EUROPE**
*See also WESTERN EUROPE*
**Solar Energy**
Solar energy: European research and development. Contractors' catalogue 1984, 12:36619 (R;XE)

**EUROPEAN MUON COLLABORATION EFFECT**
*See EMC EFFECT*

**EUROPIUM NITRATES**
**Density**
Osmotic and activity coefficients of aqueous La(NO/sub 3/)/sub 3/ and densities and apparent molal volumes of aqueous Eu(NO/sub 3/)/sub 3/ at 25°C, 12:37423 (J;US)
**Osmosis**
Osmotic and activity coefficients of aqueous La(NO/sub 3/)/sub 3/ and densities and apparent molal volumes of aqueous Eu(NO/sub 3/)/sub 3/ at 25°C, 12:37423 (J;US)

**EVACUATED COLLECTORS**
*See also EVACUATED TUBE COLLECTORS*
**Performance**
Data collection and performance reporting specifications for solar energy projects: A report of Task VI: The performance of solar heating, cooling, and hot water systems using evacuated collectors, 12:36683 (R;FR)

**EVACUATED TUBE COLLECTORS**
**Performance Testing**
Characterization of evacuated collectors, arrays, and collection subsystems: A report of Task 6: The performance of solar heating, cooling, and hot water systems using evacuated collectors, 12:36703 (R;FR)
**Thermal Efficiency**
Characterization of evacuated collectors, arrays, and collection subsystems: A report of Task 6: The performance of solar heating, cooling, and hot water systems using evacuated collectors, 12:36703 (R;FR)

**EVACUATION**
**Risk Assessment**
Evaluation of protective action risks, 12:36554 (R;US)

**EVALUATION**
**Computer Codes**
Technical/economic analyses of mine-to-market scenarios involving varying levels of coal preparation and coal water slurry production using a computerized coal evaluation model: Final report (Report includes program on a disk in pocket), 12:36364 (R;US)

**EVAPORATORS**
**Design**
Some experimental results from a new type of evaporator for heat pumps, 12:36758 (R;FI)
**Field Tests**
Some experimental results from a new type of evaporator for heat pumps, 12:36758 (R;FI)
**Heat Transfer**
Some experimental results from a new type of evaporator for heat pumps, 12:36758 (R;FI)

**Waste Product Utilization**
Some experimental results from a new type of evaporator for heat pumps, 12:36758 (R;FI)
**EVEN-EVEN NUCLEI**
*Even protons, even neutrons.*
*See also CALIFORNIUM 252*
*CARBON 12*
*CERIUM 144*
*CURIUM 244*
*DYSPROSIUM 152*
*GADOLINIUM 152*
*GADOLINIUM 154*
*GERMANIUM 76*
*LEAD 208*
*LEAD 210*
*LEAD 212*
*OSMIUM 190*
*OSMIUM 192*
*OXYGEN 18*
*PLUTONIUM 238*
*PLUTONIUM 244*
*RADIUM 226*
*RADIUM 228*
*RADON 220*
*SELENIUM 82*
*STRONTIUM 90*
*URANIUM 234*
**Nuclear Deformation**
Global set of quadrupole deformation parameters for even-even nuclei, 12:38279 (BA;DE)
**EXCHANGE (HEAT)**
*See HEAT TRANSFER*
**EXCRETION ANALYSIS**
*See PERSONNEL MONITORING*
**EXHAUST GASES**
**Air Pollution**
Passenger-car emissions in the speed range 80-120 kmph. Traffic measurements on a fleet of cars in the Pfaender Road Tunnel, 12:37183 (R;XE;In German)
Sources and evaluation of uncertainty in long-range transport models, 12:37691 (R;US)
**Carbon Monoxide**
User's guide to the TEXIN2 model--a model for predicting carbon monoxide concentrations near intersections. Interim research report, September 1979-August 1986, 12:37184 (R;US)
**Carcinogens**
Comparative potency of complex mixtures: use of short-term genetic bioassays in cancer risk assessment, 12:38003 (R;US)
**Hydrocarbons**
Gas chromatograph-based system for measuring the methane fraction of diesel-engine hydrocarbon emissions, 12:37635 (R;US)
**Mutagens**
Comparative potency of complex mixtures: use of short-term genetic bioassays in cancer risk assessment, 12:38003 (R;US)
**Particulates**
Control of atmospheric fine primary carbon particle concentrations. Final report, 12:37654 (R;US)
**Photochemical Reactions**
Combined effects of organic reactivity and NMHC/NOx ratio on photochemical-oxidant formation - a modeling study, 12:37662 (R;US)
**Soot**
Parametric investigation of soot behavior and other emissions in a gas-turbine combustor. Master's thesis, 12:36461 (R;US)
**Toxicity**
Inhalation exposure of rats to oil shale dust and diesel exhaust, 12:36476 (RA;US)
**EXPERIMENTAL BREEDER REACTOR-2**
*See EBR-2 REACTOR*
**EXPERIMENTAL FACILITIES (ACCELERATOR)**
*See ACCELERATOR FACILITIES*
**EXPLORATION**
*See also GEOTHERMAL EXPLORATION*
**Cost**
Projections of cost of development of US natural gas potential: Final report, 12:36437 (R;US)
**EXPLOSIVES**
*See also CHEMICAL EXPLOSIVES*
**Hazardous Materials**
Testing to determine relationship between explosive-contaminated sludge components and reactivity. Final report, June 1985-January 1987, 12:37837 (R;US)
**EXPOSURE (RADIATION DOSES)**
*See RADIATION DOSES*
**EXTRACTION APPARATUSES**
*See also MIXER-SETTLERS*
**Mathematical Models**
Analysis of liquid extraction for hydrometallurgical systems: Iron (III) sulfate-β-alkenyl-8-hydroxyquinoline/xylene system, 12:37424 (J;US)
**Performance**
Analysis of liquid extraction for hydrometallurgical systems: Iron (III) sulfate-β-alkenyl-8-hydroxyquinoline/xylene system, 12:37424 (J;US)
**EXTRUSION**
**Lubricants**
Lubication and surface finish of extruded aluminum, 12:37218 (R;US)

## F

**F CODES**
A high gain free electron laser amplifier design for the Alcator-C tokamak (FRED), 12:37518 (R;US)
**F MESONS**
*Prior to Jan. 1985 this information was indexed with the descriptor F-2030 RESONANCES.*
**Particle Production**
J/psi spectroscopy from MARK III, 12:38139 (RA;US)
Results from PETRA, 12:38135 (RA;US)
**Radiative Decay**
Anomalies in radiation decays of charmed mesons, 12:38208 (TG;DE)
**Weak Hadronic Decay**
Results from PETRA, 12:38135 (RA;US)
**F-2030 RESONANCES**
*See F MESONS*
**FACILITIES (ACCELERATOR)**
*See ACCELERATOR FACILITIES*
**FACILITIES (EDUCATIONAL)**
*See EDUCATIONAL FACILITIES*
**FACILITIES (MAINTENANCE)**
*See MAINTENANCE FACILITIES*
**FACILITIES (MILITARY)**
*See MILITARY FACILITIES*

*See NUCLEAR FACILITIES*
**FACILITIES (STORAGE)**
*See STORAGE FACILITIES*
**FACILITIES (TEST)**
*See TEST FACILITIES*
**FAEROE ISLANDS**
**Tidal Power Plants**
Proposal of a floating tide power plant in Vestmannasund, 12:36734 (R;DK;In Danish)
**FALLOUT**
*For radioactive fallout only.*
**Particle Size**
Particle-size determination from local fallout. Master's thesis, 12:37587 (R;US)
**Radiation Dose Distributions**
Computer fallout code using variable winds for operational-type studies. Master's thesis, 12:37586 (R;US)
**FALLOUT PARTICULATES**
*See FALLOUT PARTICLES*
**FARADAY GENERATORS**
*See MHD GENERATORS*

**FARM EQUIPMENT**
**Energy Conservation**
Energy saving by means of mutual adjustment of tractor and tools size, 12:37149 (R;DK;In Danish)
**Fuel Economy**
Energy saving by means of mutual adjustment of tractor and tools size, 12:37149 (R;DK;In Danish)
**FAROE ISLANDS**
*See FAEROE ISLANDS*
**FAST BREEDER TYPE REACTORS**
*See FBR TYPE REACTORS*
**FAST FLUX TEST FACILITY REACTOR**
*See FFTF REACTOR*
**FASTENERS**
**Inspection**
Seismic verification of nuclear plant equipment anchorage: Volume 2, Anchorage inspection workbook: Final report, 12:36828 (R;US)
**Seismic Effects**
Seismic verification of nuclear plant equipment anchorage: Volume 1, Development of anchorage guidelines: Final report, 12:36827 (R;US)
Seismic verification of nuclear plant equipment anchorage: Volume 2, Anchorage inspection workbook: Final report, 12:36828 (R;US)
**FAST-MIXED SPECTRUM REACTOR**
*See FBR TYPE REACTORS*
**FATIGUE**
**Evaluation**
Elastic creep-fatigue evaluation for ASME [American Society of Mechanical Engineers] code, 12:37505 (R;US)
**FATTY ACIDS**
*See CARBOXYLIC ACIDS*
**FAULT TOLERANT COMPUTERS**
Effects of message loss on distributed termination. Technical report, 12:38417 (R;US)
**FAULT TREE ANALYSIS**
**Expert Systems**
The application of expert systems to the analysis of logic trees, 12:38016 (R;US)
**FAULT TREE SYSTEMS**
*See FAULT TREE ANALYSIS*
**FBR TYPE REACTORS**
*See also LMFBR TYPE REACTORS*
*PFR REACTOR*
**Mixed Oxide Fuels**
Safeguards implications related to the use of mixed oxide fuel assemblies in light water reactors, 12:36571 (R;US)
**FEDERAL BUILDINGS**
**Hazardous Materials**
Health-hazard evaluation report HETA 85-289-1738, Page Belcher Federal Building, Tulsa, Oklahoma (PCBs), 12:37675 (R;US)
**FEDERAL DRIVING CYCLE**
*See FEDERAL TEST PROCEDURE*
**FEDERAL REGION I**
*Prior to June 1982 this concept was indexed to NORTH ATLANTIC REGION.*
**Air Quality**
Effects of ozone on forests in the northeastern United States, 12:37605 (R;US)
**Coastal Waters**
Shelf Edge Exchange Processes: Phase 1 (SEEP-1), Hydrography report, July 1983-October 1984, 12:38049 (R;US)
**FEDERAL REPUBLIC OF GERMANY**
**Air Pollution Abatement**
European activities in $SO_2$ and NOx emission control. Report for April 1986-March 1987, 12:36332 (R;US)
**Forests**
Dry-deposition measurements of sulfur dioxide to a spruce-fir forest in the Black Forest: a data report. Technical memo, 12:37671 (R;US)
**PWR Type Reactors**
Multidimensional representation of German pressurized water reactor primary system in 200% break LOCA calculation, 12:36864 (RA;US)
**Radioactive Waste Disposal**
Quarterly brine migration data report, April-June 1984: Nuclear waste repository simulation experiments (brine migration), Asse Mine of the Federal Republic of Germany, 12:36497 (R;US)
**Test Facilities**
PKL III small breaks and transients experimental program, 12:36843 (RA;US)
**FEDERAL TEST PROCEDURE**
Application for certification 1987 model year heavy-duty engines, 12:37168 (R;US)
Application for certification 1987 model year heavy-duty engines - Caterpillar, 12:37169 (R;US)
Application for certification 1987 model year heavy-duty engines - Chrysler, 12:37170 (R;US)
Application for certification 1987 model year heavy-duty engines - Mitsubishi Motors corporation, 12:37171 (R;JP)
Application for certification 1987 model year light-duty vehicles, 12:37172 (R;US)
Application for certification 1987 model year light-duty vehicles - Chrysler, 12:37173 (R;US)
Application for certification 1987 model year light-duty vehicles and light-duty trucks - Ford Motor Company, 12:37174 (R;US)
Application for certification 1987 model year light-duty vehicles - General Motors, 12:37175 (R;US)
Application for certification 1987 model year light-duty vehicles - Mercedes-Benz, 12:37176 (R;US)
Application for certification 1987 model year light-duty vehicles - Nissan, 12:37177 (R;JP)
Application for certification 1987 model year light-duty vehicles - American Motors Corporation (Renault), 12:37178 (R;US)
Application for certification 1987 model year light-duty vehicles - Rolls Royce, 12:37179 (R;US)
Application for certification 1987 model year light-duty vehicles - Volkswagen, 12:37180 (R;US)
Application for certification 1987 model year light-duty vehicles, 12:37181 (R;US)
Application for certification 1987 model year light-duty vehicles - Isuzu, 12:37182 (R;US)
Gas chromatograph-based system for measuring the methane fraction of diesel-engine hydrocarbon emissions, 12:37635 (R;US)
**FEDERAL WATER POLLUTION CONTROL ACT**
*See CLEAN WATER ACT*
**FEED MATERIALS PLANTS**
**Environmental Impact Statements**
Environmental Assessment of Remedial Action at the Riverton Uranium Mill Tailings Site, Riverton, Wyoming, 12:36547 (R;US)
**Remedial Action**
Remedial actions at the former Union Carbide Corporation uranium mill sites, Rifle, Garfield County, Colorado: Volume 1, Text, 12:36548 (R;US)
**FERMENTATION**
**Process Control**
Controlling of processes for producing energy carriers by means of biotechnique, 12:36602 (R;SE;In Swedish)
**FERMENTATION ALCOHOL**
*See ETHANOL*
**FERMILAB TEVATRON**
**Planning**
1 teV on 1 teV pp/p-barp dedicated collider at Fermilab using energy saver components, 12:37538 (BA;US)
**FERMIONS**
*See also LEPTONS*
**Particle Production**
Renormalization of electroweak interactions and the BREMMUS Monte Carlo simulator, 12:38167 (RA;US)
**FERRITES**
*Specific compounds should be indexed by coordination of a descriptor of the form (CATION) COMPOUNDS and the above anion descriptor.*
**Shock Waves**
Shock-modified transition metal ferrites, 12:37348 (R;US)

**FERROELECTRIC MATERIALS**
**Electronic Circuits**
A circuit for characterization of ferroelectrics, 12:37510 (R;IN)
**Hysteresis**
A circuit for characterization of ferroelectrics, 12:37510 (R;IN)
**FERROMAGNETIC MATERIALS**
**Acoustic Emission Testing**
On-line inspection of ferromagnetic materials using magnetic NDE methods, 12:37267 (BA;US)
**Electromagnetic Testing**
Computation of fields and signals due to ferromagnetic anomalies, 12:37268 (BA;US)
**Grain Size**
On-line inspection of ferromagnetic materials using magnetic NDE methods, 12:37267 (BA;US)
**Magnetic Testing**
On-line inspection of ferromagnetic materials using magnetic NDE methods, 12:37267 (BA;US)
**FFTF REACTOR**
*Westinghouse Hanford Company, Richland, Washington*
**C Codes**
CLEO: A knowledge-based refueling assistant at FFTF, 12:36815 (R;US)
**Fuel Pins**
Transient survivability of LMR oxide fuel pins, 12:36820 (R;US)
**Reactor Fueling**
CLEO: A knowledge-based refueling assistant at FFTF, 12:36815 (R;US)
**FIBER OPTICS**
**Performance**
Physiological pH fiber-optic chemical sensor based on energy transfer (Eosin and phenol red), 12:37414 (J;US)
**Research Programs**
Fiber optic instrumentation development, 12:36305 (RA;US)
**FIBROBLASTS**
**Cell Proliferation**
Changes in collagen and DNA from nickel subsulfide-injured pulmonary alveolar macrophages cultured with lung fibroblasts, 12:37971 (RA;US)
**Immunology**
Epidermal growth factor-nonresponsive 3T3 variants do not contain epidermal growth factor receptor-related antigens or mRNA, 12:37880 (J;US)
**FIELD-REVERSED MIRROR REACTORS**
**Magnetic Fields**
Field-reversed configuration formation and confinement studies on the LSM device, 12:38341 (R;US)
**Plasma Confinement**
Field-reversed configuration formation and confinement studies on the LSM device, 12:38341 (R;US)
**FIELDS (ELECTROMAGNETIC)**
*See ELECTROMAGNETIC FIELDS*
**FIELDS (MAGNETIC)**
*See MAGNETIC FIELDS*
**FILTERS**
*See also ELECTRIC FILTERS*
*OPTICAL FILTERS*
**Materials Recovery**
Use of isopropanol to distinguish $H_2SO_4$ from particulate sulfate on filters, 12:37656 (R;US)
**FILTERS (ELECTRIC)**
*See ELECTRIC FILTERS*
**FINGERPRINTING (OIL SPILLS)**
*See OIL SPILLS*
**FINITE DIFFERENCE METHOD**
Finite difference analysis of natural convection about a horizontal square rod in a cylindrical enclosure, 12:36492 (R;US)
**FINITE ELEMENT METHOD**
**Computer Codes**
Coupling boundary integral and finite element formulations for nonlinear halfspace problems, 12:38412 (R;US)
**FIRE FIGHTING**
**Health Hazards**
Health-hazard evaluation report HETA 84-484-1754, Detroit Fire Fighters, Detroit, Michigan, 12:37694 (R;US)
**FIRE HAZARDS**
**Data Compilation**
Quantitative data on the fire behavior of combustible materials found in nuclear power plants: A literature review, 12:36923 (R;US)
**FIRE STATIONS**
*See PUBLIC BUILDINGS*
**FIREDAMP**
*See METHANE*
**FIRES**
**Air Pollution**
Health-hazard evaluation report HETA 84-484-1754, Detroit Fire Fighters, Detroit, Michigan, 12:37694 (R;US)
**Computerized Simulation**
Enclosure environment characterization testing for the base line validation of computer fire simulation codes, 12:36924 (R;US)
**Environmental Effects**
Factors affecting the growth response of ponderosa pine to prescribed burning, 12:37756 (RA;US)
Fire and stand histories in subalpine forests on the Thredbo ski slopes, Koscuisko, National Park, NSW, Australia, 12:37747 (RA;US)
Fire frequency and old trees in the Southern Canadian Rockies, 12:37748 (RA;US)
Fire history of lodgepole pine of Mt. San Jacinto, California, 12:37746 (RA;US)
**Heat Transfer**
Heat transfer to large objects in large pool fires, 12:37464 (R;US)
**FIREWOOD**
*See WOOD FUELS*
**FIRS**
**Biological Stress**
Annual ring analysis on conifers for the description and assessment of forest damage (the Valais, Switzerland), 12:37602 (RA;US)
Development of old-growth Douglas-fir forests northeast of Mount St. Helens, Washington, following an A.D. 1480 eruption, 12:37750 (RA;US)
**Plant Growth**
Annual ring analysis on conifers for the description and assessment of forest damage (the Valais, Switzerland), 12:37602 (RA;US)
Development of old-growth Douglas-fir forests northeast of Mount St. Helens, Washington, following an A.D. 1480 eruption, 12:37750 (RA;US)
Recent abnormal increase in tree-ring widths: a possible effect of elevated atmospheric carbon dioxide, 12:37953 (RA;US)
Western spruce budworm outbreaks in northern New Mexico: tree-ring evidence of occurrence and radial growth impacts from 1700 to 1983, 12:37883 (RA;US)
**FISCHER-TROPSCH SYNTHESIS**
**Catalysts**
Development and process evaluation of improved Fischer-Tropsch slurry catalysts: Quarterly technical progress report for the period 17 October 1986 to 31 January 1987, 12:36582 (R;US)
Improved Fischer-Tropsch synthesis catalysts for indirect coal liquefaction: Quarterly technical progress report No. 5 for the period 1 October to 31 December 1986, 12:36583 (R;US)
Improved Fischer-Tropsch synthesis catalysts for indirect coal liquefaction: Quarterly technical progress report No. 6 for the period 1 January to 31 March 1987, 12:36584 (R;US)
Rate and selectivity modification in Fischer-Tropsch synthesis over charcoal supported molybdenum by forced concentration cycling, 12:36595 (B;US)
Slurry-phase Fischer-Tropsch synthesis, 12:36581 (R;US)
**FISHES**
**Ecology**
Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (Gulf of Mexico): Sand seatrout and silver seatrout (Cynoscion arenarius; Cynoscion nothus), 12:37836 (R;US)

**Injuries**
Ground-water temperature fluctuations at Lyons Ferry Fish Hatchery, Washington, 12:37847 (J;US)
**Liver Cells**
Effects of environmental factors (food, heavy metals) on teleostean hepatocytes, 12:37986 (R;DE;In German)

Study of saline water use at the Harry Allen Generating Station. Final report, 12:36756 (R;US)

**Environmental Impacts**
Air-quality impact analysis for Easton Utilities Commission Power Plant No. 2, units 23 and 24. Final report, 12:36762 (R;US)

**Pollution Control Equipment**
Estimating performance/costs of retrofitting control technologies at 12 coal-fired power plants. Report for November 1985-February 1987, 12:36761 (R;US)

**Waste Water**
Radioactivity in coal, ashes and selected wastewaters from Canadian coal-fired steam electric generating stations, 12:37849 (R;CA)

**FOSSILS**

**Isotope Dating**
Late Glacial reforestation in the Swiss mittelland and in Wisconsin illustrated by the Daettnau and the Two Creeks buried forests, 12:38024 (RA;US)

**FRACTURED FORMATIONS**
*See FRACTURED RESERVOIRS*

**FRACTURED RESERVOIRS**

**Liquid Flow**
An analytical solution for unsteady liquid flow in a reservoir with a uniformly fractured zone around the well, 12:36406 (BA;US)

**Multiphase Flow**
An equivalent cell block porosity and permeability concept for modeling multiphase flow in naturally fractured, lenticular reservoirs, 12:36395 (BA;US)

**Porosity**
An analytical solution for unsteady liquid flow in a reservoir with a uniformly fractured zone around the well, 12:36406 (BA;US)

**Rock-Fluid Interactions**
Case history of hydraulic fracture performance in the naturally fractured Paludal zone: The transitory effects of damage, 12:36457 (BA;US)

**FRACTURES**
*See also HYDRAULIC FRACTURES*

**Configuration**
Hydraulic and mechanical properties of natural fractures in low-permeability rock, 12:38043 (R;US)

**FRACTURING FLUIDS**

**Gelation**
Successful field application of high-temperature rheology of CO/sub 2/ foam fracturing fluids, 12:36448 (BA;US)

**Losses**
Modified fracture pressure decline analysis including pressure-dependent leakoff, 12:36399 (BA;US)

**Performance**
Polymer emulsion: The revival of a fracturing fluid, 12:36401 (BA;US)

**Rheology**
Mechanisms controlling fracture height growth in layered media, 12:36392 (BA;US)
Successful field application of high-temperature rheology of CO/sub 2/ foam fracturing fluids, 12:36448 (BA;US)

**Rock-Fluid Interactions**
Case history of hydraulic fracture performance in the naturally fractured Paludal zone: The transitory effects of damage, 12:36457 (BA;US)

**FRAGMENTATION**
A strain-rate-dependent spall mechanism transition in metals, 12:37242 (R;US)

**FRAGMENTS (FALLOUT)**
*See FALLOUT*

**FRAGMENTS (PARTICLES)**
*See PARTICLES*

**FRASCATI TOKAMAK**

**FREE CONVECTION**
*See NATURAL CONVECTION*

**FREE ELECTRON LASERS**

**Amplification**
Measurements of amplification and phase shift (wave refractive index) in a free-electron laser, 12:37472 (R;US)

**Beam Analyzers**
Cherenkov and transition radiation diagnostics for high energy free-electron lasers, 12:37483 (R;US)

**Computer-Aided Design**
Optical analysis of high power free electron laser resonators, 12:37484 (R;US)

**Laser Mirrors**
Optical analysis of high power free electron laser resonators, 12:37484 (R;US)

**Microtrons**
Increase of current from 35 to 120 mA of the 20 MeV Frascati microtron, 12:37482 (R;IT)

**Microwave Radiation**
Free-electron laser success explained, 12:37492 (J;US)

**Near Infrared Radiation**
Free-electron laser success explained, 12:37492 (J;US)

**Operation**
Analytical treatment of Free Electron Laser in the long pulse limit, 12:37477 (R;IT)
Instability in a multimode Free Electron Laser: effects of electron energy drift, 12:37476 (R;IT)
Self-consistent classical analysis of a start-up in a Free Electron Laser, 12:37478 (R;IT)
Spontaneous emission in Cerenkov FEL devices: a preliminary theoretical and experimental analysis, 12:37479 (R;IT)

**Performance Testing**
Optical analysis of high power free electron laser resonators, 12:37484 (R;US)

**Phase Shift**
Measurements of amplification and phase shift (wave refractive index) in a free-electron laser, 12:37472 (R;US)

**Research Programs**
Research and development activities on the Free Electron Laser (FEL) at the ENEA Frascati Energy Researches Center, 12:37475 (R;IT;In Italian)
**Waveguides**
Spontaneous emission in a double dielectric slab for Cerenkov-FEL operation, 12:37480 (R;IT)
**Wiggler Magnets**
A high gain free electron laser amplifier design for the Alcator-C tokamak, 12:37518 (R;US)

**FREE STEERED VEHICLES**
*See TRACKLESS VEHICLES*

**FREEZERS**
**Energy Efficiency**
Energy efficiency choice in the purchase of residential appliances, 12:37097 (BA;US)
**Market**
Energy efficiency choice in the purchase of residential appliances, 12:37097 (BA;US)

**FREEZING**
**Uses**
Industrial applications of freeze concentration technology: Final report, 12:37143 (R;US)

**FREONS**
**Physical Properties**
Heavy-liquid cycloning of fine-size coal (Freon-113), 12:36233 (R;US)

**FRESH WATER ECOSYSTEMS**
*See AQUATIC ECOSYSTEMS*

**FRESNEL LENS**
**Antireflection Coatings**
Sol-gel AR films for solar applications, 12:37369 (BA;US)

**FRICTION**
**Measuring Instruments**
A device to measure friction coefficients and contact resistance inside a scanning Auger microscope, 12:37578 (R;US)

**FRM DEVICES (THERMONUCLEAR)**
*See FIELD-REVERSED MIRROR REACTORS*

**FT TOKAMAK**
**Plasma Confinement**
Contributions to the 14th symposium on fusion technology, 12:38379 (R;IT)

**FTR REACTOR (RICHLAND)**
*See FFTF REACTOR*

**FUEL CANS**
**Eddy Current Testing**
Automated system for assessing the cladding thickness and bond integrity of tubular nuclear fuel elements, 12:36810 (R;US)
**Materials Testing**
Performance of refractory alloy-clad fuel pins, 12:36788 (R;US)
**Physical Radiation Effects**
Demonstration of a high burnup heterogeneous core using ferritic/martensitic materials, 12:36783 (R;US)
**Thickness**
Automated system for assessing the cladding thickness and bond integrity of tubular nuclear fuel elements, 12:36810 (R;US)
**Ultrasonic Testing**
Automated system for assessing the cladding thickness and bond integrity of tubular nuclear fuel elements, 12:36810 (R;US)

**FUEL CELL POWER PLANTS**
*For commercial, residential, or electric utility use.*
**Cogeneration**
Follow-on 40-kW test support program: 40-kW fuel-cell field-test data analysis. Final report, April 1980-December 1986, 12:37013 (R;US)
**Commercialization**
Status of commercial fuel cell powerplant system development, 12:37012 (R;US)
**Field Tests**
Follow-on 40-kW test support program: 40-kW fuel-cell field-test data analysis. Final report, April 1980-December 1986, 12:37013 (R;US)
**Hot Gas Cleanup**
Development of a hot gas cleanup system for integrated coal gasification/molten carbonate fuel cell power plants: Final report for the period October 1982-January 1985, 12:37011 (R;US)

**FUEL CELLS**
*See also ACID ELECTROLYTE FUEL CELLS*
**Design**
Monolithic fuel cells, 12:37010 (R;US)
**Electrodes**
High-resolution computer tomography for flaw detection in advanced thin-layer ceramics for fuel cells, 12:37009 (R;US)
**Materials Testing**
High-resolution computer tomography for flaw detection in advanced thin-layer ceramics for fuel cells, 12:37009 (R;US)
**Uses**
Monolithic fuel cells, 12:37010 (R;US)

**FUEL CONSUMPTION**
Evaluation of gas heating system retrofit pilot programs in Minnesota and Kentucky, 12:37026 (R;US)
**Taxes**
Report to Congress on the gasoline excise-tax revenues attributable to fuel used in recreational motorboats, 12:36955 (R;US)

**FUEL COOLING INSTALLATIONS**
*See SPENT FUEL STORAGE*

**FUEL ELEMENTS**
*See also FUEL RODS*
*SPENT FUEL ELEMENTS*
**Bonding**
Automated system for assessing the cladding thickness and bond integrity of tubular nuclear fuel elements, 12:36810 (R;US)
**Eddy Current Testing**
Automated system for assessing the cladding thickness and bond integrity of tubular nuclear fuel elements, 12:36810 (R;US)
**Fuel Cans**
Automated system for assessing the cladding thickness and bond integrity of tubular nuclear fuel elements, 12:36810 (R;US)
**Ultrasonic Testing**
Automated system for assessing the cladding thickness and bond integrity of tubular nuclear fuel elements, 12:36810 (R;US)

**FUEL GAS**
*See also HIGH BTU GAS*
*NATURAL GAS*
**Desulfurization**
Development of a hot gas cleanup system for integrated coal gasification/molten carbonate fuel cell power plants: Final report for the period October 1982-January 1985, 12:37011 (R;US)
Sulfur recovery from hot coal gas desulfurization processes: Final report, 12:36241 (R;US)
**Hot Gas Cleanup**
Sulfur recovery from hot coal gas desulfurization processes: Final report, 12:36241 (R;US)

**FUEL OILS**
*See also RESIDUAL FUELS*
**Combustion**
Reburning application to firetube package boilers. Final report, May 1983-September 1985, 12:37649 (R;US)
**Energy Consumption**
Trends in consumption and expenditures, 1978-1984: Residential Energy Consumption Survey, 12:37002 (R;US)
**Energy Expenses**
Trends in consumption and expenditures, 1978-1984: Residential Energy Consumption Survey, 12:37002 (R;US)
**Meetings**
1986 fuel oil utilization workshop: Proceedings, 12:36429 (R;US)
**Prices**
Char-oil-water slurry study. Final report, 25 November 1985-28 February 1987, 12:36349 (R;US)
**Uses**
1986 fuel oil utilization workshop: Proceedings, 12:36429 (R;US)

**FUEL PELLETS**
**Evaporation Model**
Alcator pellet evaporation data and the classical flux limit parameter, 12:38339 (R;US)
**FUEL REPROCESSING**
*See REPROCESSING*
**FUEL REPROCESSING PLANTS**
**Decommissioning**
Decontamination of the Scrap Removal Room at the West Valley Demonstration Project (Scrap Removal Room), 12:36508 (R;US)
**Decontamination**
Decontamination of the Scrap Removal Room at the West Valley Demonstration Project (Scrap Removal Room), 12:36508 (R;US)
**Radioactive Waste Processing**
Recovery of transuranics from process residues, 12:36513 (R;US)
**Radioactive Waste Storage**
Design of saltstone vaults, 12:36512 (R;US)
**FUEL ROD CONSOLIDATION**
*See FUEL RODS*
**FUEL RODS**
**Burnup**
Final report for the Light Water Breeder Reactor proof-of-breeding analytical support project, 12:36782 (R;US)
**Testing**
Final report for the Light Water Breeder Reactor proof-of-breeding analytical support project, 12:36782 (R;US)
**FUEL SHEATHS**
*See FUEL CANS*

Isolation and genetic analysis of mutations allowing the degradation of furans and thiophenes by Escherichia coli, 12:37870 (J;US)
**Chemical Reaction Yield**
[Production and reactions of substituted dihydrofurans and thiophenes], 12:37397 (R;US)
**Diels-Alder Reaction**
[Production and reactions of substituted dihydrofurans and thiophenes], 12:37397 (R;US)
Gas-phase intramolecular Diels-Alder reactions of 2,3-dimethylene-2,3-dihydrofurans; Formation of 9-methylanthracene and anthracene by pyrolysis; and preparation of cyclopentadienones by flash vacuum pyrolysis, 12:37398 (R;US)
**Dimerization**
[Production and reactions of substituted dihydrofurans and thiophenes], 12:37397 (R;US)
**FURFURAL**
**Chemical Reaction Yield**
Formation of aromatic compounds from carbohydrates: 10, Reaction of xylose, glucose, and glucuronic acid in acidic solution at 300°C, 12:37406 (R;US)
**FURNACES**
*See also GAS FURNACES*
*SOLAR FURNACES*
**Computerized Control Systems**
Accurate temperature control of the reheating process at mixed cold and hot charging, 12:37110 (RA;SE)
Optimizing heat distribution in continuous furnaces using a dynamic mathematical model, 12:37111 (RA;SE)
Reheating furnace automatization, 12:37112 (RA;SE)
Sophisticated reheating furnace with outstanding combustion control for high quality and energy efficiency, 12:37126 (RA;SE)
**Cost**
Molybdenum resistance heater, 12:37524 (J;US)
**Design**
Optimum design and energy saving measures of a new billet mill furnace, 12:37125 (RA;SE)
**Efficiency**
Energy optimisaton at the Whyalla reheating furnace, 12:37128 (RA;SE)
**Energy Conservation**
Energy optimisaton at the Whyalla reheating furnace, 12:37128 (RA;SE)
New slab reheating turnace of Sollac, 12:37116 (RA;SE)
Optimum design and energy saving measures of a new billet mill furnace, 12:37125 (RA;SE)
Plant solutions to reduce energy consumption in reheating furnaces, 12:37127 (RA;SE)
Reheating furnace technology in Kawasaki steel corporation, 12:37115 (RA;SE)
**Fuel Substitution**
Replacement of petroleum based fuels with lean gas in reheating furnaces, 12:37124 (RA;SE)

**Heat Recovery**
High-temperature burner-duct-recuperator (HTBDR) system low-pressure seal development: Final report, 12:37138 (R;US)
Low temperature heat recovery, 12:37104 (R;GB)
**Heat Transfer**
Numerical analysis of heat transfer in continuous reheating furnace, 12:37107 (RA;SE)
**Mathematical Models**
Mathematical reheating furnace models in STEELTEMP, 12:37106 (RA;SE)
Modelling, simulation and optimization of heating of metal in reheating furnaces, 12:37108 (RA;SE)
**Oxygen Enrichment**
Modernization of soaking pit furnaces with the aim of achieving lower energy consumption, 12:37120 (RA;SE)
Oxygen enrichment of continuous reheat furnace to increase productivity and reduce fuel consumption, 12:37119 (RA;SE)
Use of oxygen for heating furnaces, 12:37118 (RA;SE)
**Process Control**
Process control of continuous heating furnaces - strategy of a calculation model and operating results, 12:37113 (RA;SE)
Sophisticated reheating furnace with outstanding combustion control for high quality and energy efficiency, 12:37126 (RA;SE)
**Temperature Control**
Energy saving by furnace automation, 12:37114 (RA;SE)
New heating technique for improving product quality and an example of its application, 12:37117 (RA;SE)
Process control of continuous heating furnaces - strategy of a calculation model and operating results, 12:37113 (RA;SE)
**Temperature Measurement**
Two sensor measurement of slab temperature in reheat furnace: results of controlled trials on gas and oil fuels, 12:37105 (RA;SE)

*SYNTHESIS GAS*
**Air Pollution Monitoring**
Transition-flow reactor tube for measuring trace-gas concentrations, 12:37646 (R;US)
**Combustion**
Calculation of radiation spectrum of non-isothermal gas, 12:37444 (R;FI;In Finnish)
**Inorganic Compounds**
Modern continuous samplers for volatile organics and inorganic gases, 12:37665 (R;US)
**Organic Compounds**
Modern continuous samplers for volatile organics and inorganic gases, 12:37665 (R;US)

**Plumes**
Soil-gas measurement for detection of subsurface organic contamination, 12:37810 (R;US)

**GASIFICATION**
*See also COAL GASIFICATION*
**Chemical Reaction Kinetics**
Kinetics of chemisorption and gasification reactions of carbon for evaluation of the role of electron-transfer processes. Annual report, January-December 1986, 12:36460 (R;US)

**GASOLINE**
*See also UNLEADED GASOLINE*
**Forecasting**
Documentation of the integrating module and stock module of the intermediate future forecasting system, 12:36949 (R;US)
**Market**
Documentation of the integrating module and stock module of the intermediate future forecasting system, 12:36949 (R;US)
**Supply and Demand**
Documentation of the integrating module and stock module of the intermediate future forecasting system, 12:36949 (R;US)
**Taxes**
Report to Congress on the gasoline excise-tax revenues attributable to fuel used in recreational motorboats, 12:36955 (R;US)

**GASOLINE ENGINES**
*See INTERNAL COMBUSTION ENGINES*

**GENE LOCI**
*See GENES*

**GENE MUTATIONS**
**Bioassay**
Molecular approaches to the detection of germinal mutations in mammalian organisms, including man, 12:38007 (R;US)
**Screening**
Molecular approaches to the detection of germinal mutations in mammalian organisms, including man, 12:38007 (R;US)

**GENE PROMOTORS**
*See GENE REPRESSORS*

**GENE REPRESSORS**
**DNA Sequencing**
Organization and regulation of the genes for nitrogen fixation in Rhodopseudomonas capsulata: Progress report for the period June 5, 1986-June 4, 1987, 12:37862 (R;US)
**DNA-Cloning**
Organization and regulation of the genes for nitrogen fixation in Rhodopseudomonas capsulata: Progress report for the period June 5, 1986-June 4, 1987, 12:37862 (R;US)
**Fractionation**
Organization and regulation of the genes for nitrogen fixation in Rhodopseudomonas capsulata: Progress report for the period June 5, 1986-June 4, 1987, 12:37862 (R;US)

**GENERAL RELATIVITY THEORY**
*See also RELATIVITY THEORY*
**Conformal Invariance**
Conformal invariance and torsion in general relativity, 12:38314 (J;GB)
**Quantization**
Conformal invariance and torsion in general relativity, 12:38314 (J;GB)
**Torsion**
Conformal invariance and torsion in general relativity, 12:38314 (J;GB)

**GENERATING CAPACITY**
*See CAPACITY*

**GENERATORS (ELECTRIC)**
*See ELECTRIC GENERATORS*

**GENERATORS (STEAM)**
*See STEAM GENERATORS*

**GENES**
**Cloning**
Common loci for Agrobacterium tumefaciens and Rhizobium meliloti exopolysaccharide synthesis and their roles in plant interactions, 12:37865 (J;US)

**GEOLOGIC DEPOSITS**
*See also NATURAL GAS DEPOSITS*
*PETROLEUM DEPOSITS*
*SALT DEPOSITS*
**Aquifers**
Source of gross-alpha radioactivity anomalies in recharge wells, central Florida phosphate district. Final report, 12:37851 (R;US)

**GEOLOGIC FAULTS**
**Three-Dimensional Calculations**
Selection of earthquake resistant design criteria for nuclear power plants: Methodology and technical cases: Dislocation models of near-source earthquake ground motion: A review, 12:36928 (R;US)

**GEOLOGIC FRACTURES**
*See also GEOLOGIC FAULTS*
**Computerized Simulation**
The SPECTROM-31 Compliant Joint Model: A preliminary description and feasibility study: Nevada Nuclear Waste Storage Investigations project (NNWSI; jointed rock masses), 12:38046 (R;US)
**Mathematical Models**
The SPECTROM-31 Compliant Joint Model: A preliminary description and feasibility study: Nevada Nuclear Waste Storage Investigations project (NNWSI; jointed rock masses), 12:38046 (R;US)

**GEOMAGNETIC FIELD**
**Cosmic Radiation**
Correlation between asymptotic directions of cosmic-ray particles and cutoff rigidities in the evolving geomagnetic field, 12:38084 (R;US)

**GEOMAGNETIC STORMS**
*See MAGNETIC STORMS*

**GEOTHERMAL ENERGY**
Quarterly status of Department of Energy Projects, 12:36971 (R;US)

**GEOTHERMAL EXPLORATION**
*Exploration for sources of geothermal energy.*
**Research Programs**
Cleethorpes geothermal exploration borehole. Drilling and testing programme. General report , 12:36722 (R;GB)

**GEOTHERMAL FLUIDS**
**Chemical Composition**
Geothermal research at the Puna Facility, 12:36731 (R;US)
**Two-Phase Flow**
Geothermal research at the Puna Facility, 12:36731 (R;US)

**GEOTHERMAL HEATING SYSTEMS**
**Design**
Geothermal report. Low temperature radiator systems. Stage 1. Acquisition and collation of design data, 12:36727 (R;GB)

**GEOTHERMAL RESOURCES**
**Bibliographies**
Alaska geothermal bibliography, 12:36721 (R;US)

**GEOTHERMAL SPACE HEATING**
**Water Source Heat Pumps**
Geothermal aquifer studies. Heat pump study - preliminary review. Summary and recommendations, 12:36728 (R;GB)

**GEOTHERMAL SYSTEMS**
**Economic Analysis**
Heat loads in Great Grimsby. An analysis of the practicalities and economics of a hypothetical geothermal scheme, 12:36730 (R;GB)
**Resource Assessment**
Heat loads in Great Grimsby. An analysis of the practicalities and economics of a hypothetical geothermal scheme, 12:36730 (R;GB)

**GEOTHERMAL WELLS**
**Cost Benefit Analysis**
Report on an investigation to assess the potential and cost effectiveness of geothermal heating for Lindsey Comprehensive School, Cleethorpes, 12:36729 (R;GB)
**Cost Estimation**
Application of the WELC well cost estimating procedure, 12:36724 (R;GB)
WELC (version 1): well cost estimating, 12:36723 (R;GB)
**Resource Assessment**
Report on an investigation to assess the potential and cost effectiveness of geothermal heating for Lindsey Comprehensive School, Cleethorpes, 12:36729 (R;GB)

**GERMAN FEDERAL REPUBLIC**
*See FEDERAL REPUBLIC OF GERMANY*
**GERMANES**
*See GERMANIUM HYDRIDES*
**GERMANIUM**
**Energy-Level Density**
Density-of-states calculations within the recursion method, 12:38303 (J;US)
**GERMANIUM 76**
**Double Beta Decay**
Status of double beta decay of Ge, 12:38250 (BA;US)
Ultralow background searches for $\beta\beta$-decay, cold dark matter and solar axions, 12:38248 (BA;DE)
**GERMANIUM ALLOYS**
**Electric Conductivity**
Structural relaxation in Pd-Ge metallic glass, 12:37222 (R;US)
**Relaxation**
Structural relaxation in Pd-Ge metallic glass, 12:37222 (R;US)
**Superconducting Junctions**
Superconducting electronic-film structures. Annual report, 1 January-31 December 1985, 12:37448 (R;US)
**Superconductivity**
Superconducting electronic-film structures. Annual report, 1 January-31 December 1986, 12:37325 (R;US)
**GERMANIUM HYDRIDES**
**Chemical Reactions**
The free-radical and ion chemistry of volatile silanes, germanes and phosphines: Annual informal technical report, November 1, 1986-May 31, 1987, 12:37432 (R;US)
**Photochemical Reactions**
The free-radical and ion chemistry of volatile silanes, germanes and phosphines: Annual informal technical report, November 1, 1986-May 31, 1987, 12:37432 (R;US)
**GERMANY (FEDERAL REPUBLIC)**
*See FEDERAL REPUBLIC OF GERMANY*
**GIANT RESONANCE**
**Decay**
Photon decay of giant resonances, 12:38263 (BA;DE)
**GLASS**
*See also BOROSILICATE GLASS*
*PHOSPHATE GLASS*
**Chemical Reactions**
PbO reduction and crucible reactions of PbO . 30 wt % $B_2O_3$ glass, 12:37302 (R;US)
**Melting**
PbO reduction and crucible reactions of PbO . 30 wt % $B_2O_3$ glass, 12:37302 (R;US)
**Structural Chemical Analysis**
Spectroscopic investigations of glass structure: Final report for the period April 1, 1984-December 31, 1986, 12:37334 (R;US)
**GLASSY METALS**
*See METALLIC GLASSES*
**GLAUBER THEORY**
Space-time picture of relativistic propagation of medium energy hadrons through nuclei, 12:38289 (BA;US)
**GLAUBER'S SALT**
*See SODIUM SULFATES*
**GLOW DISCHARGES**
**Positive Column**
Radial density distribution of negative atomic oxygen in the oxygen positive column: an experiment. Master's thesis, 12:38100 (R;US)
**GLUCOSE**
**Decomposition**
Formation of aromatic compounds from carbohydrates: 10, Reaction of xylose, glucose, and glucuronic acid in acidic solution at 300°C, 12:37406 (R;US)
**Fermentation**
Physiological adaptations of anaerobic bacteria to low pH: metabolic control of proton motive force in Sarcina ventriculi, 12:36604 (J;US)
**GLUCURONIC ACID**
**Decomposition**
Formation of aromatic compounds from carbohydrates: 10, Reaction of xylose, glucose, and glucuronic acid in acidic solution at 300°C, 12:37406 (R;US)
**GLUEBALLS**
**Particle Production**
Physics from PEP, 12:38134 (RA;US)
Search for gluonic bound states in high energy proton-proton collisions, 12:38154 (D;US)
**Research Programs**
Experimental investigations of production of glueballs and meson resonant states, 12:38123 (R;US)
**GLUON MODEL**
**Research Programs**
[Intermediate/high energy probes and the structure of nuclei]: Final report, 12:38270 (R;US)
**GLUONIUM**
*See GLUEBALLS*
**GLUTATHIONE**
**Biological Effects**
Effect of time of glutathione depletion on ozone-induced pulmonary fibrosis, 12:37975 (RA;US)
**Biological Functions**
Possible role of reduced glutathione in the development of pulmonary fibrosis, 12:37974 (RA;US)
**Tissue Distribution**
Effect of exogenous sources of cysteine on lung glutathione levels, 12:37982 (RA;US)
**GLYCOLS**
*See also POLYETHYLENE GLYCOLS*
**Corrosive Effects**
System selection and life testing results of drain down and glycol closed loop active systems, 12:36660 (BA;US)
**Solvent Properties**
Vapor-liquid equilibria of sulfur dioxide in polar organic solvents, 12:37411 (J;US)
**GOBAR GAS**

**Hydraulics**
Analysis results from the Los Alamos 2D/3D program, 12:36863 (RA;US)
Comparison of a TRAC calculation to the data from LSTF run SB-CL-05, 12:36849 (RA;US)
Development of reflood model at JAERI, 12:36861 (RA;US)
Experimental and best estimate code development on small break LOCA thermal-hydraulics and hydrogen mixing within subcompartmental containment vessel, 12:36917 (RA;US)
Heat transfer enhancement in SCTF tests, 12:36860 (RA;US)
Multidimensional representation of German pressurized water reactor primary system in 200% break LOCA calculation, 12:36864 (RA;US)
PKL III small breaks and transients experimental program, 12:36843 (RA;US)
PWR recovery procedures investigated in the LOBI-MOD2 test facility, 12:36842 (RA;US)
Results of 5% small-break LOCA tests and natural circulation tests at the ROSA-IV LSTF, 12:36848 (RA;US)
SCTF-III test plan and recent SCTF-III test result, 12:36859 (RA;US)
Semiscale recovery investigations: a comparison of results from Semiscale Mod-2C small break LOCA without HPI tests, 12:36847 (RA;US)
Small-break loss of coolant accident (SBLOCA) test results from the multiloop integral system test (MIST) facility, 12:36844 (RA;US)
Small break loss of coolant test results for UMCP 2 x 4 loop one- and two-phase natural circulation in multi-loop system, 12:36846 (RA;US)
Summary of CCTF test results, 12:36858 (RA;US)
TRAC-PF1/MOD1 pretest predictions of MIST experiments, 12:36845 (RA;US)
Two-phase flow measurement in the upper plenum of a PWR during reflood, 12:36851 (RA;US)
**Natural Convection**
Simulation experiments for hot-leg u-bend two-phase flow phenomena, 12:36855 (RA;US)
**T Codes**
TRAC-PF1/MOD1 pretest predictions of MIST experiments, 12:36845 (RA;US)
**Test Facilities**
Semiscale recovery investigations: a comparison of results from Semiscale Mod-2C small break LOCA without HPI tests, 12:36847 (RA;US)
**Two-Phase Flow**
Simulation experiments for hot-leg u-bend two-phase flow phenomena, 12:36855 (RA;US)
**LOST CIRCULATION**
**Research Programs**
Research in lost circulation control for geothermal wells, 12:36726 (R;US)
**LOUISIANA**
**Paleoclimatology**
Regeneration of baldcypress (Taxodium distichum (L.) Rich.) as related to drought in the LaBranche wetlands of Southern Louisiana, 12:38021 (RA;US)
**LOW-BETA PLASMA**
*Beta from 0 to 0.01.*
**Ballooning Instability**
Confinement of a self-stabilized tokamak under average magnetic well conditions, 12:38330 (R;US)
**Stability**
Low beta rigid mode stability criterion for an arbitrary Larmor radius plasma, 12:38334 (R;US)
**LOW-LEVEL RADIOACTIVE WASTES**
**Grouting**
Pretreatment of Hanford PUREX Plant first-cycle waste, 12:36532 (R;US)
**Leaching**
Accelerated Leach Test(s) Program: Annual report, 12:36500 (R;US)
**Processing**
Pretreatment of Hanford PUREX Plant first-cycle waste, 12:36532 (R;US)
**Radioactive Waste Disposal**
Considerations on a de minimis dose and disposal of exempt concentrations of radioactive wastes, 12:36525 (R;US)
Pilot-scale grout production test with a simulated low-level waste, 12:36527 (R;US)
**Radioactive Waste Management**
F-Area Seepage Basins: Environmental information document, 12:37826 (R;US)
**Radioactive Waste Processing**
Materials used in low-level liquid waste reprocessing/treatment studies at Oak Ridge National Laboratory, 12:36502 (R;US)
**Solidification**
Materials used in low-level liquid waste reprocessing/treatment studies at Oak Ridge National Laboratory, 12:36502 (R;US)
Pilot-scale grout production test with a simulated low-level waste, 12:36527 (R;US)
**Underground Disposal**
Materials used in low-level liquid waste reprocessing/treatment studies at Oak Ridge National Laboratory, 12:36502 (R;US)
**LP-GAS**
*See LIQUEFIED PETROLEUM GASES*
**LUBRICANTS**
**Performance Testing**
Lubication and surface finish of extruded aluminum, 12:37218 (R;US)
**LUMINESCENT CONCENTRATORS**
**Design**
Luminescent solar concentrator development: Final subcontract report, 1 June 1982-31 December 1984, 12:36705 (R;US)
**Efficiency**
Luminescent solar concentrator development: Final subcontract report, 1 June 1982-31 December 1984, 12:36705 (R;US)
**Research Programs**
Luminescent solar concentrator development: Final subcontract report, 1 June 1982-31 December 1984, 12:36705 (R;US)
**LUNG CLEARANCE**
**Mathematical Models**
Model analysis of respiratory tract clearance of particles inhaled by people, 12:37970 (RA;US)
**LUNGS**
**Carcinomas**
Toxicity of $^{239}PuO_2$ in immature Beagle dogs. VIII, 12:37920 (RA;US)
**Chemical Composition**
Alterations of bronchoalveolar lavage cytology in cynomolgus monkeys after sequential saline lavages, 12:37869 (RA;US)
Trace element analyses in order to determine heavy metal concentrations in lung tissues. A contribution to an objective assessment of occupational hazards, 12:37985 (R;DE;In German)
**Dynamic Function Studies**
Cardiopulmonary function of dogs with plutonium-induced chronic lung injury, 12:37924 (RA;US)
Cross-sectional study of the effects of age on pulmonary function and lung morphology of Beagle dogs, 12:37887 (RA;US)
Effects of body position on pulmonary function of the F344/N rat, 12:37886 (RA;US)
Work performance evaluation using the exercising rat model, 12:37959 (R;US)
**Fibrosis**
Cardiopulmonary function of dogs with plutonium-induced chronic lung injury, 12:37924 (RA;US)
Effect of time of glutathione depletion on ozone-induced pulmonary fibrosis, 12:37975 (RA;US)
Possible role of reduced glutathione in the development of pulmonary fibrosis, 12:37974 (RA;US)
Repeated inhalation exposure of Beagle dogs to aerosols of $^{239}PuO_2$. X, 12:37922 (RA;US)

Toxicity of $^{239}PuO_2$ inhaled by aged Beagle dogs. VIII, 12:37921 (RA;US)
**Immune Reactions**
Histopathology of secondary immune responses in the primate lung, 12:37884 (RA;US)
**Lavage**
Alterations of bronchoalveolar lavage cytology in cynomolgus monkeys after sequential saline lavages, 12:37869 (RA;US)
**Neoplasms**
Effects of relatively low-level exposure of rats to inhaled $^{144}CeO_2$. II, 12:37925 (RA;US)
Repeated inhalation exposure of Beagle dogs to aerosols of $^{239}PuO_2$. X, 12:37922 (RA;US)
Toxicity of $^{90}Y$ in a relatively insoluble form inhaled by Beagle dogs. XVIII, 12:37911 (RA;US)
Toxicity of $^{144}Ce$ inhaled in a relatively insoluble from by immature Beagle dogs. XV, 12:37914 (RA;US)
Toxicity of inhaled $^{239}PuO_2$ in Beagle dogs. A. Monodisperse 0.75 μm AMAD particles. B. Monodisperse 1.5 μm AMAD particles. C. Monodisperse 3.0 μm AMAD particles. IX, 12:37919 (RA;US)
**Radiation Doses**
Biological effects of repeated inhalation exposure of Beagle dogs to relatively insoluble aerosols of $^{144}Ce$. XII, 12:37916 (RA;US)
Repeated inhalation exposure of Beagle dogs to aerosols of $^{239}PuO_2$. X, 12:37922 (RA;US)
Toxic effects of inhaled $^{244}Cm_2O_3$ in rats. IV, 12:37926 (RA;US)
Toxicity of $^{90}Y$ in a relatively insoluble form inhaled by Beagle dogs. XVIII, 12:37911 (RA;US)
Toxicity of $^{144}Ce$ inhaled in a relatively insoluble form by Beagle dogs XIX, 12:37913 (RA;US)
Toxicity of $^{144}Ce$ inhaled in a relatively insoluble from by immature Beagle dogs. XV, 12:37914 (RA;US)
Toxicity of $^{90}Sr$ inhaled in a relatively insoluble form by Beagle dogs. XV, 12:37915 (RA;US)
Toxicity of inhaled $^{238}PuO_2$ in Beagle dogs: A. Monodisperse 1.5 μ AMAD particles. B. Monodisperse 3.0 μm particles. XIII, 12:37918 (RA;US)
Toxicity of inhaled $^{239}PuO_2$ in Beagle dogs. A. Monodisperse 0.75 μm AMAD particles. B. Monodisperse 1.5 μm AMAD particles. C. Monodisperse 3.0 μm AMAD particles. IX, 12:37919 (RA;US)
Toxicity of $^{239}PuO_2$ in immature Beagle dogs. VIII, 12:37920 (RA;US)
Toxicity of $^{239}PuO_2$ inhaled by aged Beagle dogs. VIII, 12:37921 (RA;US)
**Radionuclide Kinetics**
Biokinetics of $^{239}Pu$ in immature dogs that inhaled $^{239}PuO_2$, 12:37906 (RA;US)
**Sensitivity**
Inhalation exposure of rats to oil shale dust and diesel exhaust, 12:36476 (RA;US)
Lung cellular response and lymphocyte blastogenesis, 12:37973 (RA;US)

**LWBR TYPE REACTORS**
**Fuel Rods**
Final report for the Light Water Breeder Reactor proof-of-breeding analytical support project, 12:36782 (R;US)

**LYMANTRIA DISPAR**
**Insecticides**
Health-hazard evaluation report HETA 85-309-1739, Oregon Department of Human Resources, Health Division, Gypsy Moth Control Project, Eugene, Oregon, 12:37631 (R;US)

**LYMPH NODES**
**Carcinomas**
Biological effects of repeated inhalation exposure of Beagle dogs to relatively insoluble aerosols of $^{144}Ce$. XII, 12:37916 (RA;US)
**Neoplasms**
Toxicity of $^{144}Ce$ inhaled in a relatively insoluble from by immature Beagle dogs. XV, 12:37914 (RA;US)
**Radionuclide Kinetics**
Biokinetics of $^{239}Pu$ in immature dogs that inhaled $^{239}PuO_2$, 12:37906 (RA;US)
**Sarcomas**
Biological effects of repeated inhalation exposure of Beagle dogs to relatively insoluble aerosols of $^{144}Ce$. XII, 12:37916 (RA;US)

**LYMPHOCYTES**
**Cell Proliferation**
Lung cellular response and lymphocyte blastogenesis, 12:37973 (RA;US)

**Supply and Demand**
Documentation of the integrating module and stock module of the intermediate future forecasting system, 12:36949 (R;US)

**NATURAL GAS WELLS**
**Carbon Dioxide Injection**
Successful field application of high-temperature rheology of CO/sub 2/ foam fracturing fluids, 12:36448 (BA;US)
**Directional Drilling**
Devonian shale horizontal well: Rationale for wellsite selection and well design, 12:36451 (BA;US)
Low-permeability reservoirs development using horizontal wells, 12:36402 (BA;US)
Performance comparison of vertical and horizontal hydraulic fractures and horizontal boreholes in low permeability reservoirs: A numerical study, 12:36453 (BA;US)
Recovery efficiency aspects of horizontal well drilling in Devonian shale, 12:36434 (BA;US)
Short-radius lateral drilling: A completion alternative, 12:36408 (BA;US)
**Feasibility Studies**
Reservoir properties required for profitable stimulations, 12:36450 (BA;US)
**Flow Models**
An equivalent cell block porosity and permeability concept for modeling multiphase flow in naturally fractured, lenticular reservoirs, 12:36395 (BA;US)
**Flow Rate**
Short-radius lateral drilling: A completion alternative, 12:36408 (BA;US)
**Formation Damage**
An analytical solution for unsteady liquid flow in a reservoir with a uniformly fractured zone around the well, 12:36406 (BA;US)
Gas recovery from deep millidarcy layered gas formations with nonlinear elastic deformation characteristics, 12:36443 (BA;US)
New methods for estimating parameters of low permeability reservoirs, 12:36407 (BA;US)
**Hydraulic Fracturing**
Advances in borehole seismic fracture diagnostics, 12:36403 (BA;US)
An analytical solution for unsteady liquid flow in a reservoir with a uniformly fractured zone around the well, 12:36406 (BA;US)
An assessment of tight sand development potential in the south Rulison area, Garfield County, Colorado, 12:36442 (BA;US)
An equivalent cell block porosity and permeability concept for modeling multiphase flow in naturally fractured, lenticular reservoirs, 12:36395 (BA;US)
Case history of hydraulic fracture performance in the naturally fractured Paludal zone: The transitory effects of damage, 12:36457 (BA;US)
Coupling of production forecasting, fracture geometry requirements and treatment scheduling in the optimum hydraulic fracture design, 12:36391 (BA;US)
Depositional setting and production characteristics of low permeability sandstones, upper Cretaceous Olmos Formation, South Texas, 12:36397 (BA;US)
Devonian shale horizontal well: Rationale for wellsite selection and well design, 12:36451 (BA;US)
Dynamic etching tests aid fracture acidizing treatment design, 12:36390 (BA;US)
Gas recovery from deep millidarcy layered gas formations with nonlinear elastic deformation characteristics, 12:36443 (BA;US)
Hydraulic fracturing model based on a 3D closed form: Tests, analysis of fracture geometry, and containment, 12:36393 (BA;US)
Hydraulic fracture treatment design simulation for the Rotliegendes formation, 12:36449 (BA;US)
In-situ stresses in low-permeability, nonmarine rocks, 12:36404 (BA;US)

Low-permeability reservoirs development using horizontal wells, 12:36402 (BA;US)
Mechanical interactions in branched or subparallel hydraulic fractures, 12:36398 (BA;US)
Modified fracture pressure decline analysis including pressure-dependent leakoff, 12:36399 (BA;US)
New methods for estimating parameters of low permeability reservoirs, 12:36407 (BA;US)
Observations and recommendations in the evaluation of tests of hydraulically fractured wells, 12:36405 (BA;US)
On the stimulation of a northern North Sea tight sand, 12:36396 (BA;US)
Performance comparison of vertical and horizontal hydraulic fractures and horizontal boreholes in low permeability reservoirs: A numerical study, 12:36453 (BA;US)
Polymer emulsion: The revival of a fracturing fluid, 12:36401 (BA;US)
Pressure transient response in multilayer gas reservoirs containing hydraulic fractures, 12:36455 (BA;US)
Proceedings of the 1987 SPE/DOE joint symposium on low permeability reservoirs, 12:36388 (B;US)
Realistic fracture conductivities of proppants as a function of reservoir temperature, 12:36389 (BA;US)
Reservoir properties required for profitable stimulations, 12:36450 (BA;US)
Successful field application of high-temperature rheology of CO/sub 2/ foam fracturing fluids, 12:36448 (BA;US)
The analysis of complex Travis Peak reservoirs in east Texas, 12:36441 (BA;US)
The effects of lithology and reservoir pressure on the in-situ stresses in the Waskom (Travis Peak) field, 12:36454 (BA;US)
The GRI staged field experiment, 12:36440 (BA;US)
The influence of fracture toughness on the geometry of hydraulic fractures, 12:36394 (BA;US)
The influence of reservoir properties and geologic setting on coalbed fracturing and production: A preliminary evaluation of the TEAM project, 12:36444 (BA;US)
Transient pressure behavior of multiple-fractured gas wells, 12:36456 (BA;US)

**Mathematical Models**
An assessment of tight sand development potential in the south Rulison area, Garfield County, Colorado, 12:36442 (BA;US)

**Meetings**
Proceedings of the 1987 SPE/DOE joint symposium on low permeability reservoirs, 12:36388 (B;US)

**Performance**
Performance comparison of vertical and horizontal hydraulic fractures and horizontal boreholes in low permeability reservoirs: A numerical study, 12:36453 (BA;US)

**Pressure Gradients**
Transient pressure behavior of multiple-fractured gas wells, 12:36456 (BA;US)

**Production**
An analysis of the coal and coalbed methane resources of the Piceance Basin, Colorado, 12:36447 (BA;US)
Depositional setting and production characteristics of low permeability sandstones, upper Cretaceous Olmos Formation, South Texas, 12:36397 (BA;US)
Devonian shale horizontal well: Rationale for wellsite selection and well design, 12:36451 (BA;US)
Recovery efficiency aspects of horizontal well drilling in Devonian shale, 12:36434 (BA;US)
Source rock evaluation: A method of predicting dominant reservoir mechanisms of deeply buried, low-permeability coal reservoirs, 12:36446 (BA;US)
The influence of reservoir properties and geologic setting on coalbed fracturing and production: A preliminary evaluation of the TEAM project, 12:36444 (BA;US)
The use of simulation and history matching to determine critical coalbed methane reservoir properties, 12:36445 (BA;US)

**Productivity**
Rate-sensitivity and the optimal choice of production capacity of petroleum reservoirs, 12:36371 (R;NO)

**Propping Agents**
Hydraulic fracture treatment design simulation for the Rotliegendes formation, 12:36449 (BA;US)
Long-term performance of proppants under simulated reservoir conditions, 12:36400 (BA;US)
On the stimulation of a northern North Sea tight sand, 12:36396 (BA;US)

**Reservoir Pressure**
The effects of lithology and reservoir pressure on the in-situ stresses in the Waskom (Travis Peak) field, 12:36454 (BA;US)

**Resource Depletion**
Rate-sensitivity and the optimal choice of production capacity of petroleum reservoirs, 12:36371 (R;NO)

**NICKEL**
**Acoustic Emission Testing**
On-line inspection of ferromagnetic materials using magnetic NDE methods, 12:37267 (BA;US)
**Catalytic Effects**
Transient temperature technique applied to study activity pattern changes during the hydrogenation of CO over nickel/silica catalysts, 12:36594 (J;US)
**Creep**
The migration and coalescence of tritium-induced helium bubbles during creep in nickel, 12:38388 (J;US)
**Grain Size**
On-line inspection of ferromagnetic materials using magnetic NDE methods, 12:37267 (BA;US)
**Helium Embrittlement**
The migration and coalescence of tritium-induced helium bubbles during creep in nickel, 12:38388 (J;US)
**Magnetic Testing**
On-line inspection of ferromagnetic materials using magnetic NDE methods, 12:37267 (BA;US)
**Radiation Effects**
Design of a single variable helium effects experiment for irradiation in FFTF [Fast Flux Test Facility] using alloys enriched in nickel 59, 12:37220 (R;US)
**Toxicity**
Changes in collagen and DNA from nickel subsulfide-injured pulmonary alveolar macrophages cultured with lung fibroblasts, 12:37971 (RA;US)
**NICKEL 58 TARGET**
**Neutron Reactions**
Calculated neutron-induced cross sections for /sup 58,60/Ni from 1 to 20 MeV and comparisons with experiments, 12:38274 (R;US)
**NICKEL 59**
**Radiation Effects**
Design of a single variable helium effects experiment for irradiation in FFTF [Fast Flux Test Facility] using alloys enriched in nickel 59, 12:37220 (R;US)
**NICKEL 60 TARGET**
**Neutron Reactions**
Calculated neutron-induced cross sections for /sup 58,60/Ni from 1 to 20 MeV and comparisons with experiments, 12:38274 (R;US)
**NICKEL 64 REACTIONS**
**Heavy Ion Fusion Reactions**
Angular momentum effects in subbarrier fusion, 12:38251 (R;US)
**NICKEL 64 TARGET**
**Oxygen 18 Reactions**
Microscopic analysis of projectile excitation for /sup 18/O+/sup 64/Ni, 12:38276 (J;US)
**NICKEL BASE ALLOYS**
*See also ALLOY-IN-100*
**Annealing**
Effect of tensile stress on the annealed structure of a metallic glass, 12:37253 (J;US)
**Corrosion**
An assessment of performance of materials for FBC [fluidized-bed combustion] air heater applications, 12:37208 (R;US)
**Corrosion Resistance**
Laboratory evaluations of cobalt-free, nickel-based hard-facing alloys for nuclear applications: Topical report, 12:37219 (R;US)
**Erosion**
An assessment of performance of materials for FBC [fluidized-bed combustion] air heater applications, 12:37208 (R;US)
**Mechanical Properties**
Laboratory evaluations of cobalt-free, nickel-based hard-facing alloys for nuclear applications: Topical report, 12:37219 (R;US)
**Microhardness**
Effect of tensile stress on the annealed structure of a metallic glass, 12:37253 (J;US)
**Reactor Materials**
Laboratory evaluations of cobalt-free, nickel-based hard-facing alloys for nuclear applications: Topical report, 12:37219 (R;US)
**Stress Relaxation**
Effect of tensile stress on the annealed structure of a metallic glass, 12:37253 (J;US)
**Wear Resistance**
Laboratory evaluations of cobalt-free, nickel-based hard-facing alloys for nuclear applications: Topical report, 12:37219 (R;US)

**Weldability**
Laboratory evaluations of cobalt-free, nickel-based hard-facing alloys for nuclear applications: Topical report, 12:37219 (R;US)

**NICKEL COMPLEXES**
**Catalytic Effects**
Nickel site of methane catalysis in the methyl reductase enzyme, 12:36593 (R;US)

**NICKEL COMPOUNDS**
*See also NICKEL OXIDES*
**Shock Waves**
Shock-modified transition metal ferrites, 12:37348 (R;US)

**NICKEL OXIDES**
**Catalytic Effects**
Effect of phosphorus on the activity of Ni-Mo/alumina coal-liquid upgrading catalysts, 12:36279 (J;US)

**NICKEL-CADMIUM BATTERIES**
**Battery Chargers**
Aircraft battery state of charge and charge-control system. Interim report, 1 July 1985-30 June 1986, 12:36940 (R;US)

**NICKEL-CHROMIUM STEELS**
**Mechanical Properties**
Procurement and screening test data for advanced austenitic alloys for 650 degrees C steam service (Part 1, 14Cr-16Ni steels and 20Cr-30Ni-Fe alloys), 12:36755 (R;US)

**NIOBIUM**
**Cladding**
Laser cladding of Mg and Nb alloys for improved environmental resistance. Annual report, January 1986-January 1987, 12:37201 (R;US)
**Oxidation**
Effect of alloying, rapid solidification, and surface kinetics on the high-temperature environmental resistance of niobium. Annual technical report, November 1985-January 1986, 12:37198 (R;US)

**NIOBIUM ALLOYS**
*See also INCONEL 600*
**Corrosion Resistance**
Laser cladding of Mg and Nb alloys for improved environmental resistance. Annual report, January 1986-January 1987, 12:37201 (R;US)
**Oxidation**
Effect of alloying, rapid solidification, and surface kinetics on the high-temperature environmental resistance of niobium. Annual technical report, November 1985-January 1986, 12:37198 (R;US)
**Superconducting Junctions**
Superconducting electronic-film structures. Annual report, 1 January-31 December 1985, 12:37448 (R;US)
**Superconductivity**
Importance of spacing in the development of high current densities in multifilamentary superconductors, 12:37255 (J;GB)
Superconducting electronic-film structures. Annual report, 1 January-31 December 1986, 12:37325 (R;US)

**NIOBIUM CARBIDES**
**Creep**
Kinetics and mechanisms of creep in hot isostatically pressed niobium carbide, 12:37281 (R;US)

**NIOBIUM NITRIDES**
**Superconducting Junctions**
Superconducting electronic-film structures. Annual report, 1 January-31 December 1986, 12:37325 (R;US)
Superconducting electronic-film structures. Annual report, 1 January-31 December 1985, 12:37448 (R;US)
**Superconductivity**
Microstructure, resistivity and the anisotropy of the upper critical field in NbN thin films, 12:37283 (R;US)

**NITRATES**
*See also EUROPIUM NITRATES*
*LANTHANUM NITRATES*
**Absorption Heat**
The feasibility and potential of a direct absorption receiver in a nitrate salt solar power system, 12:36668 (BA;US)
**Adsorption**
Comparison of indoor dust samples collected in different environments, 12:37618 (RA;US)

**NITRIC ACID**
**Air Pollution**
Nitric acid-air diffusion coefficient: experimental determination, 12:37639 (R;US)
**Air Pollution Monitoring**
Transition-flow reactor tube for measuring trace-gas concentrations, 12:37646 (R;US)
**Atmospheric Chemistry**
Studies of the mechanisms and rates with which nitrogen species are incorporated into cloud water and precipitation (second annual report), 12:37658 (R;US)

**NITRIC OXIDE**
*NO.*
**Chemical Reactions**
The free-radical and ion chemistry of volatile silanes, germanes and phosphines: Annual informal technical report, November 1, 1986-May 31, 1987, 12:37432 (R;US)

**NITROCELLULOSE**
**Aging**
Evidence for differences in stability between nitrate ester positions on the cellulose nitrate ring, 12:37585 (R;US)
**NMR Spectra**
Evidence for differences in stability between nitrate ester positions on the cellulose nitrate ring, 12:37585 (R;US)
**Quantitative Chemical Analysis**
An attempt to use high resolution FTIR spectra to determine the population of the various nitrate esters in cellulose nitrate, 12:37381 (R;US)
**Stability**
Evidence for differences in stability between nitrate ester positions on the cellulose nitrate ring, 12:37585 (R;US)

**NITROGEN**
**Atmospheric Chemistry**
Studies of the mechanisms and rates with which nitrogen species are incorporated into cloud water and precipitation (second annual report), 12:37658 (R;US)
**Biological Effects**
Interaction of $H_2O$ and nitrogen stresses on trees: Progress report, 1 October 1986 to 30 September 1987, 12:36627 (R;US)
**Equations of State**
Temperature-dependent parameters and the Peng-Robinson equation of state, 12:37413 (J;US)
**Excitation**
Studies of infrared aurorae. Technical report, 12:38041 (R;US)
**Ion Collisions**
State-selected study of ion-molecule reactions using tandem molecular beam photoionization mass spectrometry. II. Absolute spin-orbit-state excitation cross sections for the reactions $Ar^+(^2P/sub\ 3/2/) + Ar(^1S_0)$ and $Ar^+(^2P/sub\ 3/2/) + N_2(X,v = 0)$, 12:38097 (D;US)
**Raman Spectroscopy**
Application of CARS to scramjet combustion. Final report, 12:37376 (R;US)
**Uptake**
Availability and distribution of heavy metals, nitrogen, and phosphorus from sewage sludge in the plant-soil-water continuum, 12:37840 (R;US)
**Vapor Pressure**
Temperature-dependent parameters and the Peng-Robinson equation of state, 12:37413 (J;US)

**NITROGEN 14 REACTIONS**
**Fragmentation**
Intermediate-mass fragments from nonbinary processes in the reaction of /sup 14/N on Ag at E/A = 35 MeV, 12:38254 (J;US)

**NITROGEN DIOXIDE**
$NO_2$.
**Biological Effects**
Work performance evaluation using the exercising rat model, 12:37959 (R;US)
**Deposition**
Experimental study of sulfur and NOx fluxes over grassland, 12:37648 (R;US)

**Environmental Transport**
Two-zone modelling for air exchange rates and $NO_2$ source and decay rates in a Southern California residential indoor air quality study, 12:37600 (R;US)
**Indoor Air Pollution**
Investigation of nitrogen dioxide removal from indoor air. Final report, December 1984-September 1986, 12:37686 (R;US)
**Pollution Sources**
Two-zone modelling for air exchange rates and $NO_2$ source and decay rates in a Southern California residential indoor air quality study, 12:37600 (R;US)
**Removal**
Investigation of nitrogen dioxide removal from indoor air. Final report, December 1984-September 1986, 12:37686 (R;US)

**NITROGEN FIXATION**
**Gene Regulation**
Organization and regulation of the genes for nitrogen fixation in Rhodopseudomonas capsulata: Progress report for the period June 5, 1986-June 4, 1987, 12:37862 (R;US)
**Molecular Biology**
Organization and regulation of the genes for nitrogen fixation in Rhodopseudomonas capsulata: Progress report for the period June 5, 1986-June 4, 1987, 12:37862 (R;US)

**NITROGEN NITRIDES**
*See NITROGEN*

**NITROGEN OXIDES**
*See also NITRIC OXIDE*
*NITROGEN DIOXIDE*
*NITROUS OXIDE*
**Air Pollution Control**
Comprehensive report to Congress Clean Coal Technology Program: Enhancing the use of coals by gas reburning and sorbent injection, 12:36326 (R;US)
**Atmospheric Chemistry**
Studies of the mechanisms and rates with which nitrogen species are incorporated into cloud water and precipitation (second annual report), 12:37658 (R;US)
**Control**
Chemistry of oxidant formation: implications for designing effective control strategies, 12:37655 (R;US)
Multistaged approach for in-furnace NOx control. Report for August 1986-February 1987, 12:37522 (R;US)
Reburning application to firetube package boilers. Final report, May 1983-September 1985, 12:37649 (R;US)
**Infrared Spectra**
Studies of infrared aurorae. Technical report, 12:38041 (R;US)
**Photochemical Reactions**
Combined effects of organic reactivity and NMHC/NOx ratio on photochemical-oxidant formation - a modeling study, 12:37662 (R;US)
**Removal**
Combined SO/sub x//No/sub x/ removal and concentration from flue gas through an electrochemical membrane: Progress report for the period June 1984-January 1987, 12:37606 (R;US)
European activities in $SO_2$ and NOx emission control. Report for April 1986-March 1987, 12:36332 (R;US)
FGD (flue-gas desulfurization), SCR (selective-catalytic-reduction) gain: coal-fired-boiler experience in Japan, 12:36334 (R;US)
NO/sub x/ and $SO_2$ removal from flue gas by ferrous ion-peptide solutions, 12:36330 (R;US)

**NITROSO COMPOUNDS**
**Carcinogenesis**
Interaction of radiation and carcinogens in the production of mutations, 12:37928 (RA;US)
**Toxicity**
Interaction of radiation and carcinogens in the production of mutations, 12:37928 (RA;US)

**NITROUS OXIDE**
*$N_2O$.*
**Indoor Air Pollution**
Health-hazard evaluation report HETA 86-403-1747, St. James Community Hospital, Butte, Montana, 12:37684 (R;US)

Separation and characterization of coal derived components, 1 April 87-31 June 87, 12:36310 (R;US)

**ORGANIC OXYGEN COMPOUNDS**
*Excluding HYDROXY COMPOUNDS, CARBONIC ACID DERIVATIVES, LIPIDS, STEROIDS, CARBOHYDRATES, ORGANIC ACIDS, ALDEHYDES, KETONES and ESTERS.*
*See also DIOXIN*
*EPOXIDES*
*FURANS*
*QUINONES*
**Chemical Reactions**
Oxidation of heterocyclic amines, sulfilimines, and phosphine imines with dimethyldioxirane, 12:37400 (R;US)

**ORGANIC SOLVENTS**
Chelating extractants of improved selectivity: Final report, 12:37373 (R;US)
**Cleaning**
Canyon solvent cleaning (HM Process solvent), 12:36485 (R;US)
Canyon solvent cleaning with solid adsorbents (HM Process solvent (TBP in n-paraffin)), 12:36486 (R;US)
**Health Hazards**
Health-hazard evaluation report HETA 85-416-1742, Roofing and Waterproofing Sites, Chicago, Illinois, 12:37890 (R;US)
**Indoor Air Pollution**
Health-hazard evaluation report HETA 85-482-1730, HETA 86-116-1730, Winters Industry Foundry, Canton, Ohio, 12:37626 (R;US)
Health-hazard evaluation report HETA 85-518-1737, LCI Excelon Products, Inc., Woodland, Washington, 12:37629 (R;US)
**Vapors**
Health-hazard evaluation report HETA 86-037-1749, Lamiglas, Woodland, Washington, 12:37683 (R;US)

**ORGANIC SULFUR COMPOUNDS**
*See also POLYCYCLIC SULFUR HETEROCYCLES*
*SULFONATES*
*SULFONES*
*THIOPHENE*
*TTF*
**Crystal Structure**
Synthesis, structure and properties of BEDT-TTF derivatives, 12:37408 (R;US)
**Electric Conductivity**
Synthesis, structure and properties of BEDT-TTF derivatives, 12:37408 (R;US)
**Synthesis**
4,5-methylenedithio-4',5'-propylenedithiotetrathiafulvalene (MPT) and 4,5-ethylenedithio-4',5'-propylenedithiotetrathiafulvalene (EPT), 12:37389 (R;US)
Synthesis, structure and properties of BEDT-TTF derivatives, 12:37408 (R;US)
**Uses**
[Production and reactions of substituted dihydrofurans and thiophenes], 12:37397 (R;US)

**ORGANIC WASTES**
*See also AGRICULTURAL WASTES*
**Anaerobic Digestion**
Utilization of solid matter and the saving of energy within the sphere of the sugar industry by means of the biotechnical use of extracted cossettes - Phase 2. Final report, 12:36596 (R;DE;In German)
**Enzymatic Hydrolysis**
Utilization of solid matter and the saving of energy within the sphere of the sugar industry by means of the biotechnical use of extracted cossettes - Phase 2. Final report, 12:36596 (R;DE;In German)

**ORGANOMETALLIC COMPOUNDS**
*For compounds of metals and semimetals with organic compounds, but only when the metal or semimetal is directly bound to carbon.*
**Crystal Structure**
Synthesis, structure and properties of BEDT-TTF derivatives, 12:37408 (R;US)
**Electric Conductivity**
Synthesis, structure and properties of BEDT-TTF derivatives, 12:37408 (R;US)
**Synthesis**
Synthesis of organometallic compounds: Final technical report, 12:37336 (R;US)
Synthesis, structure and properties of BEDT-TTF derivatives, 12:37408 (R;US)

**ORGDP**
**Radioactive Waste Disposal**
Health and Safety Program for ground-water investigations at 39 waste management sites within the Oak Ridge Gaseous Diffusion Plant, Oak Ridge, Tennessee, 12:36518 (R;US)
**Waste Disposal**
Health and Safety Program for ground-water investigations at 39 waste management sites within the Oak Ridge Gaseous Diffusion Plant, Oak Ridge, Tennessee, 12:36518 (R;US)
**Water Pollution Monitors**
Monitor well installation at K-1407-B and K-1407-C surface impoundments at the Oak Ridge Gaseous Diffusion Plant, 12:36517 (R;US)

**ORNL**
**Bibliographies**
Biomedical and Environmental Sciences Programs: Publications 1986, 12:37859 (R;US)
**Geology**
Geophysical data from boreholes DM1, DM2, DM3, and DM3a, New Hydraulic Fracturing Facility, Oak Ridge National Laboratory, Oak Ridge, Tennessee, 12:36523 (R;US)
**Hydraulic Fracturing**
Geophysical data from boreholes DM1, DM2, DM3, and DM3a, New Hydraulic Fracturing Facility, Oak Ridge National Laboratory, Oak Ridge, Tennessee, 12:36523 (R;US)
**Radioactive Waste Disposal**
Geophysical data from boreholes DM1, DM2, DM3, and DM3a, New Hydraulic Fracturing Facility, Oak Ridge National Laboratory, Oak Ridge, Tennessee, 12:36523 (R;US)
**Radioactive Waste Management**
Materials used in low-level liquid waste reprocessing/treatment studies at Oak Ridge National Laboratory, 12:36502 (R;US)
**Radioactive Waste Processing**
Materials used in low-level liquid waste reprocessing/treatment studies at Oak Ridge National Laboratory, 12:36502 (R;US)

*Code number 1.*
*See also HYDROXYLASES*
*OXYGENASES*
**Catalytic Effects**
Nickel site of methane catalysis in the methyl reductase enzyme, 12:36593 (R;US)
**Enzyme Activity**
Isolation and characterization of cytochrome P-450 isozymes from mouse liver, 12:37978 (RA;US)
Metabolism of gallate and phloroglucinol in Eubacterium oxidoreducens via 3-hydroxyl-5-oxohexanoate, 12:38009 (J;US)
**OXIRANS**
*See EPOXIDES*
**OXYGEN**
**Adsorption**
Formation of a metastable ordered surface phase due to competitive diffusion and adsorption kinetics: Oxygen on Pd(100), 12:37353 (J;US)
**Crystal Structure**
Formation of a metastable ordered surface phase due to competitive diffusion and adsorption kinetics: Oxygen on Pd(100), 12:37353 (J;US)
**Diffusion**
Formation of a metastable ordered surface phase due to competitive diffusion and adsorption kinetics: Oxygen on Pd(100), 12:37353 (J;US)
**Equations of State**
Temperature-dependent parameters and the Peng-Robinson equation of state, 12:37413 (J;US)
**Isotope Ratio**
Model for simulating the variation in the oxygen isotope ratio in the meltwater discharge from the marginal zone of the Inland Ice at Pakitsup akuliarusersua, Jakobshavn, 12:38038 (R;DK;In Danish)
**Measuring Instruments**
The Harwell oxygen sensors: Description, operating conditions and performance, 12:37576 (R;GB)
**Raman Spectroscopy**
Application of CARS to scramjet combustion. Final report, 12:37376 (R;US)
**Vapor Pressure**
Temperature-dependent parameters and the Peng-Robinson equation of state, 12:37413 (J;US)
**OXYGEN 16 REACTIONS**
**Heavy Ion Fusion Reactions**
Angular momentum effects in subbarrier fusion, 12:38251 (R;US)
Energetic particle emission and linear momentum transfer in central collisions induced by 32.5 MeV/nucleon $^{16}O$ + $^{238}U$, $^{197}Au$, 12:38261 (R;US)
**Momentum Transfer**
Energetic particle emission and linear momentum transfer in central collisions induced by 32.5 MeV/nucleon $^{16}O$ + $^{238}U$, $^{197}Au$, 12:38261 (R;US)
**Optical Models**
An optical model analysis of $^{16}O$ + $^{12}C$ elastic scattering at E/A = 94 MeV, 12:38266 (R;US)
**Reaction Kinetics**
Energetic particle emission and linear momentum transfer in central collisions induced by 32.5 MeV/nucleon $^{16}O$ + $^{238}U$, $^{197}Au$, 12:38261 (R;US)
**OXYGEN 16 TARGET**
**Hypernuclei**
Studies of hypernuclei by associated production, 12:38237 (R;US)
**Pion Plus Reactions**
Experimental studies of nucleon-nucleon and pion-nucleus interactions at intermediate energies: Progress report, January 1, 1985-December 31, 1987, 12:38238 (R;US)
Studies of hypernuclei by associated production, 12:38237 (R;US)
**OXYGEN 18**
**Energy Levels**
Microscopic analysis of projectile excitation for /sup 18/O+/sup 64/Ni, 12:38276 (J;US)
**OXYGEN 18 REACTIONS**

In situ real-time analysis of particulates, 12:36355 (RA;US)
**Optimization**
In-situ particle characterization, 12:36307 (RA;US)
**Performance Testing**
In situ real-time analysis of particulates, 12:36355 (RA;US)
**PARTICLE TRACKS**
**Data Acquisition Systems**
Low-light-level video system for data acquisition from optical particle detectors, 12:37565 (R;DE)
**PARTICLES**
*When appropriate use more specific terms listed under CHARGED PARTICLES, ELEMENTARY PARTICLES, and QUASI PARTICLES.*
*See also PARTICULATES*
**Indoor Air Pollution**
Levels of dusts, bacteria and fungal spores in houses and daycare centers with forced air heating system and at some complain sites, 12:37090 (R;FI;In Finnish)
**Sampling**
Indoor particle concentration and the outdoor to indoor transport. Part 3. Effects of airconditioning systems, 12:37088 (R;FI;In Finnish)
Levels of dusts, bacteria and fungal spores in houses and daycare centers with forced air heating system and at some complain sites, 12:37090 (R;FI;In Finnish)
**PARTICULATES**
*Prior to September 1981, this concept was indexed to PARTICLES and AEROSOLS.*
**Air Pollution Abatement**
Control of atmospheric fine primary carbon particle concentrations. Final report, 12:37654 (R;US)
**Air Pollution Control**
Electrostatic precipitator guidelines: Volume 2, Operations and maintenance: Final report, 12:37609 (R;US)
**Chemical Composition**
Characteristics of radioactive particles released from the Chernobyl nuclear reactor, 12:36832 (RA;US)

**Compression Strength**
Kinetic behavior of solid particles in fluidized beds: Solid particle kinetic forces: Progress report for the period October 1-December 31, 1986 (Two-phase granules held together by surface tension), 12:36354 (R;US)
**Corrosive Effects**
Effects of sheltering and orientation on the atmospheric corrosion of structural metals, 12:37634 (R;US)
**Deposition**
Characteristics of radioactive particles released from the Chernobyl nuclear reactor, 12:36832 (RA;US)
Dry deposition of acidic gases and particles. Final report, 12:37667 (R;US)
Experimental study of sulfur and NOx fluxes over grassland, 12:37648 (R;US)
**Electrostatic Precipitators**
Comparison of electrostatic-precipitator performance with pulse and d-c energization, 12:37668 (R;US)
**Health Hazards**
Air-Quality Criteria for Particulate Matter and Sulfur Oxides (1982) (second addendum): assessmet of newly available health-effects information. Final report, 12:37642 (R;US)
**Heating**
Rapid heating of gas/small particle mixture, 12:37410 (J;US)
**Indoor Air Pollution**
Health-hazard evaluation report HETA 83-162-1746, Handy and Harman, Inc., Fairfield, Connecticut, 12:37680 (R;US)
Health-hazard evaluation report HETA 85-306-1753, Timken, Inc., Canton, Ohio, 12:37692 (R;US)
Health-hazard evaluation report HETA-82-059-1752, Art Academy of Cincinnati, Cincinnati, Ohio, 12:37693 (R;US)
Health-hazard evaluation report HETA 85-046-1763, American Crystal Sugar Company, East Grand Forks, Minnesota, 12:37697 (R;US)
Health-hazard evaluation report HETA 85-045-1762, American Crystal Sugar Co., Crookston, Minnesota, 12:37702 (R;US)
**Inhalation**
Model analysis of respiratory tract clearance of particles inhaled by people, 12:37970 (RA;US)
**Kinetics**
Kinetic behavior of solid particles in fluidized beds: Solid particle kinetic forces: Progress report for the period October 1-December 31, 1986 (Two-phase granules held together by surface tension), 12:36354 (R;US)
**Lung Clearance**
Model analysis of respiratory tract clearance of particles inhaled by people, 12:37970 (RA;US)
**Measuring Methods**
Drag force and slip correction factor of aggregates measured in a Millikan apparatus, 12:37613 (RA;US)
Particle evolution in MHD systems, 12:37005 (R;US)
**Membrane Transport**
Translocation of particles by macrophages from lung to lymph nodes of rats, 12:37964 (RA;US)
**Morphology**
Morphology and size distribution of atmospheric particles deposited on foliage and inert surfaces, 12:36321 (J;US)
**Particle Size**
Cigarette smoke aerosol in a Walton smoke machine, 12:37614 (RA;US)
Morphology and size distribution of atmospheric particles deposited on foliage and inert surfaces, 12:36321 (J;US)
**Removal**
Parameter monitoring for real-time electrostatic precipitator trouble shooting. Report for March-August 1985, 12:37652 (R;US)
**Retention**
Translocation of particles by macrophages from lung to lymph nodes of rats, 12:37964 (RA;US)
**Sorptive Properties**
Rapid heating of gas/small particle mixture, 12:37410 (J;US)
**Standards**
Review of the national ambient air-quality standards for particulate matter: updated assessment of scientific and technical information. Addendum to the 1982 OAQPS (Office of Air Quality Planning and Standards) staff paper. Final report, 12:37727 (R;US)
**Sulfates**
Use of isopropanol to distinguish $H_2SO_4$ from particulate sulfate on filters, 12:37656 (R;US)
**Tensile Properties**
Kinetic behavior of solid particles in fluidized beds: Solid particle kinetic forces: Progress report for the period October 1-December 31, 1986 (Two-phase granules held together by surface tension), 12:36354 (R;US)
**PASSIVE SOLAR HEATING SYSTEMS**
**Thermal Efficiency**
Determination of R-values from in-situ dynamic thermal test data in light weight roof systems, 12:36690 (BA;US)
**PATHOLOGICAL CHANGES**
**Monitoring**
Problems in the planning of forest damage inventories, 12:37801 (RA;DE)
**Symptoms**
Thinning out of the tree crown - what is hidden in that integrated measure of forest damage, 12:37939 (RA;DE)
**PBFA**

*LIQUEFIED PETROLEUM GASES*
**Combustion Products**
Sulfur dioxide emissions from oil refineries and combustion of oil products in western europe (1985), 12:37647 (R;NL)
**Forecasting**
Documentation of the integrating module and stock module of the intermediate future forecasting system, 12:36949 (R;US)
**Market**
Documentation of the integrating module and stock module of the intermediate future forecasting system, 12:36949 (R;US)
**Marketing**
Mathematical programming studies of short run oil refinery rents, 12:36410 (R;DE)
**Supply and Demand**
Documentation of the integrating module and stock module of the intermediate future forecasting system, 12:36949 (R;US)

**PETROLEUM REFINERIES**
**Air Pollution**
Sulfur dioxide emissions from oil refineries and combustion of oil products in western europe (1985), 12:37647 (R;NL)
**Competition**
Mathematical programming studies of short run oil refinery rents, 12:36410 (R;DE)
**Economic Analysis**
Mathematical programming studies of short run oil refinery rents, 12:36410 (R;DE)
**Health Hazards**
Evaluation of the carcinogenicity of unleaded gasoline, 12:38002 (R;US)
**Separation Processes**
The use of membranes in hybrid industrial separation systems: Final report, 12:37142 (R;US)
**Systems Analysis**
Mathematical programming studies of short run oil refinery rents, 12:36410 (R;DE)

**PETROLEUM RESIDUES**
*B.P. over 1100°F, 593°C; includes oil residues, residua.*
**Refining**
Catalytic coprocessing: Effect of catalyst type and sequencing, 12:36281 (J;US)

**PETT**
*See POSITRON COMPUTED TOMOGRAPHY*

**PFR REACTOR**
**Fuel Pins**
Transient survivability of LMR oxide fuel pins, 12:36820 (R;US)

**PHARMACEUTICALS**
*See DRUGS*

**PHASE CHANGE MATERIALS**
*Use with the specific phase change material (e.g. calcium chloride) when known.*
**Latent Heat Storage**
Energy storage in phase-change materials. Development of a component model compatible with the 'TRNSYS' transient simulation program. Final report, 12:36938 (R;DE)
**Tanks**
Energy storage in phase-change materials. Development of a component model compatible with the 'TRNSYS' transient simulation program. Final report, 12:36938 (R;DE)

**PHASE DIAGRAMS**
**Computer Calculations**
Application of computer methods for calculation of multicomponent phase diagrams of high-temperature structural ceramics. Annual report, 1 March 1986-27 February 1987, 12:37279 (R;US)

**PHASE STUDIES**
**Equations of State**
Continuous thermodynamics for phase equilibria and enthalpy calculations. Annual report, September 1, 1985-December 31, 1986, 12:36464 (R;US)

**PHENANTHRENE**
**Ecological Concentration**
Physical and chemical characterization of the process stream for a commercial scale fluidized bed combustor at the East Stroudsburg University, 12:37619 (RA;US)
**Solubility**
Mutual solubilities in six binary mixtures of water + a heavy hydrocarbon or a derivative, 12:37418 (J;US)

**PHENOLS**
*See also CRESOLS*
**Alkylation**
Structural information from the selective methylation of acidic O-H and C-H sites in an Argonne premium coal sample, 12:36297 (R;US)
**Chemical Reaction Yield**
Formation of aromatic compounds from carbohydrates: 10, Reaction of xylose, glucose, and glucuronic acid in acidic solution at 300°C, 12:37406 (R;US)
**Chromatography**
Application of XAD-4 solid sorbent and HPLC [high performance liquid chromatography] with electrochemical detection to the analysis of phenols in water: Final report, November 1983-November 1985, 12:37377 (R;US)
**Gas Chromatography**
Organic solute profile of water from Rio Blanco Retort 1, 12:36473 (R;US)
**Indoor Air Pollution**
Health hazard evaluation report HETA 86-018-1758, Robbins and Myers, Incorporated, Moyno Products Division, Springfield, Ohio, 12:37696 (R;US)

NRL (Naval Research Laboratory) plasma formulary, (revised), 12:38098 (R;US)
Solar-Geophysical Data Number 510, February 1987. Part 2 (comprehensive reports). Data for August 1986, 12:38066 (R;US)
**Advection**
Rigorous upper bounds for transport due to passive advection by inhomogeneous turbulence, 12:38349 (R;US)
**Atom Transport**
Measurement of the local particle diffusion coefficient in a magnetized plasma, 12:38357 (J;US)
**Bibliographies**
Plasma physics abstracts, 1 January - 31 December, 1986, 12:38343 (R;US)
**Current-Drive Heating**
Anomalous current penetration and oscillating current drive in tokamaks, 12:38359 (J;US)
**Dispersion Relations**
Symmetry properties of a multidimensional dispersion functional, 12:38363 (J;US)
**Electron Plasma Waves**
Observation of steepening in electron plasma waves driven by stimulated Raman backscattering, 12:38365 (J;US)
**Heat Flux**
Rigorous upper bounds for transport due to passive advection by inhomogeneous turbulence, 12:38349 (R;US)
**Joule Heating**
Resistive-heating instability of a compressible, force-free plasma, 12:38362 (J;US)
**Neutral-Particle Transport**
Vectorizing and macrotasking Monte Carlo neutral particle algorithms, 12:38352 (R;US)
**Nonlinear Problems**
Observation of steepening in electron plasma waves driven by stimulated Raman backscattering, 12:38365 (J;US)
**Plasma Diagnostics**
Observation of steepening in electron plasma waves driven by stimulated Raman backscattering, 12:38365 (J;US)
**Plasma Pressure**
Resistive-heating instability of a compressible, force-free plasma, 12:38362 (J;US)
**Raman Effect**
Observation of steepening in electron plasma waves driven by stimulated Raman backscattering, 12:38365 (J;US)
**Tearing Instability**
Resistive-heating instability of a compressible, force-free plasma, 12:38362 (J;US)
**Turbulent Flow**
Rigorous upper bounds for transport due to passive advection by inhomogeneous turbulence, 12:38349 (R;US)

PLASMA DIAGNOSTICS
Ion Beams
Measurement of the local particle diffusion coefficient in a magnetized plasma, 12:38357 (J;US)
Magnetic Probes
Plasma formation and equilibrium in a high $\beta$ tokamak, 12:38361 (J;US)
Optical Spectrometers
Measurement of the local particle diffusion coefficient in a magnetized plasma, 12:38357 (J;US)
Ruby Lasers
Observation of steepening in electron plasma waves driven by stimulated Raman backscattering, 12:38365 (J;US)
X-Ray Spectrometers
High-pressure duo-multichannel soft x-ray spectrometer for tokamak plasma diagnostics, 12:38347 (R;US)
PLASMA INSTABILITY
Plasma theory and simulation. Quarterly progress report Nos. 3 and 4, 1 July-31 December 1985, 12:38319 (R;US)
Instability Growth Rates
Electron heating by ion acoustic turbulence in simulated low Mach number shocks, 12:38364 (J;US)
Ion Acoustic Waves
Electron heating by ion acoustic turbulence in simulated low Mach number shocks, 12:38364 (J;US)
N Codes
NOVA: A nonvariational code for solving the MHD stability of axisymmetric toroidal plasmas, 12:38366 (J;US)
PLASMA OSCILLATIONS
*See PLASMA WAVES*
PLASMA SHEET
Ion Drift
Generation of broadband noise in the magnetotail, 12:38081 (R;US)
PLASMA SIMULATION
Solution to workshop problem 6 (hollow sphere) in the shell approximation with EDDYNET-2D, 12:38322 (R;US)
Numerical Solution
Direct implicit electromagnetic plasma simulation, 12:38356 (R;US)
PLASMA WAVES
Plasma theory and simulation. Quarterly progress report Nos. 3 and 4, 1 July-31 December 1985, 12:38319 (R;US)
Bibliographies
Plasma physics abstracts, 1 January - 31 December, 1986, 12:38343 (R;US)

PLUMES
Gas Analysis
Soil-gas measurement for detection of subsurface organic contamination, 12:37810 (R;US)
PLUTONIUM
Chemical Preparation
[Small scale direct oxide reduction (DOR) experiments], 12:36491 (R;US)
Electrorefining
Design and evaluation of plutonium electrorefining cells, 12:36484 (R;US)
Recovery
Aqueous methods for recovery of plutonium from pyrochemical residues, 12:36490 (R;US)
Recovery of transuranics from process residues, 12:36513 (R;US)
Uptake
Interactions of plutonium and americium with bone mineral, 12:37907 (RA;US)
PLUTONIUM 238
Inhalation
Toxicity of inhaled alpha-emitting radionuclides - status report, 12:37917 (RA;US)
Toxicity
Toxicity of inhaled alpha-emitting radionuclides - status report, 12:37917 (RA;US)
Toxicity of inhaled $^{238}PuO_2$ in Beagle dogs: A. Monodisperse 1.5 $\mu$ AMAD particles. B. Monodisperse 3.0 $\mu$m particles. XIII, 12:37918 (RA;US)
PLUTONIUM 239
Air Pollution Monitoring
Evaluation of an L-shell X-ray based continuous air monitor for airborne plutonium for use in the waste isolation pilot plant, 12:37716 (RA;US)
Inhalation
Biokinetics of $^{239}Pu$ in immature dogs that inhaled $^{239}PuO_2$, 12:37906 (RA;US)
Repeated inhalation exposure of Beagle dogs to aerosols of $^{239}PuO_2$. X, 12:37922 (RA;US)
Toxicity of inhaled alpha-emitting radionuclides - status report, 12:37917 (RA;US)
Radioecological Concentration
Evaluation of an L-shell X-ray based continuous air monitor for airborne plutonium for use in the waste isolation pilot plant, 12:37716 (RA;US)
Retention
Biokinetics of $^{239}Pu$ in immature dogs that inhaled $^{239}PuO_2$, 12:37906 (RA;US)

**Toxicity**
Cardiopulmonary function of dogs with plutonium-induced chronic lung injury, 12:37924 (RA;US)
Influence of heterogeneous alpha irradiation of Chinese hamster liver on the induction of cancer. II, 12:37927 (RA;US)
Repeated inhalation exposure of Beagle dogs to aerosols of $^{239}PuO_2$. X, 12:37922 (RA;US)
Toxicity of inhaled alpha-emitting radionuclides - status report, 12:37917 (RA;US)
Toxicity of inhaled $^{239}PuO_2$ in Beagle dogs. A. Monodisperse 0.75 μm AMAD particles. B. Monodisperse 1.5 μm AMAD particles. C. Monodisperse 3.0 μm AMAD particles. IX, 12:37919 (RA;US)
Toxicity of $^{239}PuO_2$ in immature Beagle dogs. VIII, 12:37920 (RA;US)
Toxicity of $^{239}PuO_2$ inhaled by aged Beagle dogs. VIII, 12:37921 (RA;US)

**PLUTONIUM 244**
**Abundance**
The early solar system abundance of $^{244}Pu$ as inferred from the St. Severin chondrite, 12:38070 (R;US)

Regulatory guide in support of ECCS rule revision, 12:36838 (RA;US)
RELAP5/MOD2 development, 12:36866 (RA;US)
Results from assessment of RELAP5/MOD2 and TRAC-PF1 in the FRG, 12:36872 (RA;US)
Revision of the ECCS rule, 12:36837 (RA;US)
Sandia code accuracy quantification and its application to TRAC-PF1/MOD1 assessment, 12:36880 (RA;US)
Scaling of thermal mixing phenomena from one-fifth to full scale test facilities, 12:36857 (RA;US)
SCDAP/RELAP5 update and applications, 12:36908 (RA;US)
SCTF-III test plan and recent SCTF-III test result, 12:36859 (RA;US)
Semiscale recovery investigations: a comparison of results from Semiscale Mod-2C small break LOCA without HPI tests, 12:36847 (RA;US)
Simulation experiments for hot-leg u-bend two-phase flow phenomena, 12:36855 (RA;US)
Some preliminary results of post-dryout heat transfer measurements at low qualities and pressures up to 20 bar, 12:36883 (RA;US)
Status of integral facilities and future plans for integral testing, 12:36840 (RA;US)
Status of J-TRAC code development, 12:36887 (RA;US)
STCP validation, 12:36909 (RA;US)
Steam separator modeling for various nuclear reactor accidents, 12:36853 (RA;US)
Summary of CCTF test results, 12:36858 (RA;US)
Swedish experience with RELAP5/MOD2 assessment, 12:36874 (RA;US)
Tests of the TRAC code against known analytical solutions for stratified flow, 12:36881 (RA;US)
Thermal mixing tests in a semiannular downcomer with interacting flows from cold legs, 12:36856 (RA;US)
TRAC code development status and plans, 12:36867 (RA;US)
Two-phase flow measurement in the upper plenum of a PWR during reflood, 12:36851 (RA;US)
UPTF test results--first three separate effects tests, 12:36862 (RA;US)
US Department of Energy Nuclear Plant Life Extension Program, 12:36929 (R;US)

**Reactor Shutdown**
Analysis of balance-of-plant regulatory issues: Final report, 12:36926 (R;US)

**Reliability**
US Department of Energy Nuclear Plant Life Extension Program, 12:36929 (R;US)

**RHR Systems**
Precursors to potential severe core damage accidents, 1984: A status report: Appendixes C, D, and E, 12:36922 (R;US)

**Risk Assessment**
Use of probabilistic systems analysis for enhancing plant operational safety and productivity, 12:36891 (RA;US)

**Rod Bundles**
Dryout front modeling for rod bundles, 12:36852 (RA;US)

**Service Life**
US Department of Energy Nuclear Plant Life Extension Program, 12:36929 (R;US)

**Source Terms**
STCP validation, 12:36909 (RA;US)

**Steam Separators**
Steam separator modeling for various nuclear reactor accidents, 12:36853 (RA;US)

**Systems Analysis**
Analysis of balance-of-plant regulatory issues: Final report, 12:36926 (R;US)
**Temperature Measurement**
Degradation of nuclear plant temperature sensors, 12:36774 (R;US)
**Transients**
Application of engineering and multi-dimensional, finite difference codes to HDR thermal mixing experiments, 12:36888 (RA;US)
Assessment of uncertainty identification for RELAP5/MOD2 and TRAC-BD1/MOD1 1 codes under core uncovery and reflooding conditions, 12:36885 (RA;US)
Code uncertainty quantification, 12:36879 (RA;US)
Cold leg condensation in a large break LOCA using TRAC-PF1/MOD1, 12:36882 (RA;US)
CSNI validation matrix for PWR and BWR codes, 12:36873 (RA;US)
Finnish assessment of RELAP5/MOD2, 12:36875 (RA;US)
JRC ISPRA experience with the IBM version of RELAP5/MOD2, 12:36884 (RA;US)
Nuclear plant analyzer development at the Idaho National Engineering Laboratory, 12:36868 (RA;US)
Results from assessment of RELAP5/MOD2 and TRAC-PF1 in the FRG, 12:36872 (RA;US)
Sandia code accuracy quantification and its application to TRAC-PF1/MOD1 assessment, 12:36880 (RA;US)
Status of J-TRAC code development, 12:36887 (RA;US)
Tests of the TRAC code against known analytical solutions for stratified flow, 12:36881 (RA;US)

Quarterly brine migration data report, October-December 1983: Nuclear Waste Repository simulation experiments (brine migration), Asse Mine of the Federal Republic of Germany, 12:36496 (R;US)
**Mathematical Models**
Analytic models of nuclide transport in saturated geologic media, 12:36533 (R;US)
Modeling study of solute transport in the unsaturated zone: Workshop proceedings, 12:37850 (R;US)
Subseabed Disposal Project annual report: Ocean modeling studies, October 1983 through September 1984 (From subseabed disposal in ocean), 12:36536 (R;US)
**T Codes**
Analytic models of nuclide transport in saturated geologic media, 12:36533 (R;US)
**RADIONUCLIDE TRANSFER (IN ENVIRONMENT)**
*See RADIONUCLIDE MIGRATION*
**RADIONUCLIDE TRANSFER (IN ORGANISMS)**
*See RADIONUCLIDE KINETICS*
**RADIONUCLIDE TURNOVER**
*See RADIONUCLIDE KINETICS*
**RADIONUCLIDES**
*See RADIOISOTOPES*
**RADIOPHARMACEUTICALS**
**Impurities**
Comparative investigations of different measurement methods of Radiochromatograms for the evaluation of the radiochemical purity of ten radiopharmaceuticals, 12:37438 (R;DE;In German)
Radiochemical purity and stability of I-131/I-125/I-123 o-iodohippuric acids. A market analysis, 12:37439 (R;DE;In German)
**Qualitative Chemical Analysis**
Comparative investigations of different measurement methods of Radiochromatograms for the evaluation of the radiochemical purity of ten radiopharmaceuticals, 12:37438 (R;DE;In German)
Radiochemical purity and stability of I-131/I-125/I-123 o-iodohippuric acids. A market analysis, 12:37439 (R;DE;In German)
**Stability**
Radiochemical purity and stability of I-131/I-125/I-123 o-iodohippuric acids. A market analysis, 12:37439 (R;DE;In German)
**RADIOPROTECTIVE SUBSTANCES**
*See also DTPA*
*GLUTATHIONE*
Evaluation of drugs for prevention of hyperthermia in rats exposed to microwave irradiation. Final report, 1983-1985, 12:38013 (R;US)
**RADIOSURGERY**
*See RADIOTHERAPY*
**RADIOTHERAPY**
**Research Programs**
Experimental tumour therapy. 1985 report. Report on the cooperation between the Institute of Radiation Biology of the University of Munich and the Institute for Radiation Biology of the Society for Radiation and Environmental Research, Neuherberg, 12:37903 (R;DE;In German)
**Synchrotrons**
Proton accelerator for medical applications, 12:37533 (J;NL)
**RADIUM**
**Environmental Exposure Pathway**
Multidisciplinary study of radionuclides and heavy-metal concentrations in wildlife on phosphate-mined and reclaimed lands. Final report, 12:36551 (R;US)
**RADIUM 226**
**Radioecological Concentration**
An improved method for the simultaneous determination of $^{224}Ra$, $^{226}Ra$ and $^{228}Ra$ in water, soils and sediments, 12:37848 (R;US)
**RADIUM 228**
**Radioecological Concentration**
An improved method for the simultaneous determination of $^{224}Ra$, $^{226}Ra$ and $^{228}Ra$ in water, soils and sediments, 12:37848 (R;US)
**RADIUM D**
*See LEAD 210*
**RADON**
**Air Pollution Control**
Monitoring before and after radon mitigation, 12:37719 (R;US)
Resolving the radon problem in Clinton, New Jersey houses. Published paper, April-December 1986, 12:37718 (R;US)
Some results from the demonstration of indoor radon reduction measures in block basement houses. Report for June 1985-February 1987, 12:37720 (R;US)
Statistical aspects of autoregressive models in the assessment of radon mitigation, 12:37717 (R;US)
**Air Pollution Monitoring**
Performance of continuous air monitors based on alpha spectroscopy in a dusty environment, 12:37714 (RA;US)
**Indoor Air Pollution**
Bibliography on indoor radon pollution, 12:37721 (R;US)
**Pollution Sources**
Radon source rate measurements using multiple perfluorocarbon tracers, 12:37709 (R;US)
**Radiation Monitors**
Study on indoor air impurities, 12:37089 (R;FI;In Finnish)
**Radioecological Concentration**
Performance of continuous air monitors based on alpha spectroscopy in a dusty environment, 12:37714 (RA;US)
Radon source rate measurements using multiple perfluorocarbon tracers, 12:37709 (R;US)
The impacts of balanced and exhaust mechanical ventilation on indoor radon, 12:37712 (R;US)
Validation of the abbreviated Radon Progeny Integrating Sampling Unit (RPISU) method for Mesa County, Colorado, 12:37820 (R;US)
**Scintillation Counting**
Statistical aspects of autoregressive models in the assessment of radon mitigation, 12:37717 (R;US)
**RADON 220**
**Daughter Products**
Diffusivity study of free thoron decay products by deposition measurement on cylindrical tubes and screens, 12:37713 (RA;US)
**RAILGUN ACCELERATORS**
**Energy Efficiency**
Superconducting augmented rail gun (SARG). Final technical report, 12:37528 (R;US)
**Magnetic Fields**
Superconducting augmented rail gun (SARG). Final technical report, 12:37528 (R;US)
**RAMAN SPECTROSCOPY**
*Prior to March 1983 this concept was indexed to RAMAN SPECTRA.*
**Performance Testing**
Advanced coherent Raman diagnostics for coal gasification streams, 12:36304 (RA;US)
**RANGELANDS**
**Air Pollution**
Experimental study of sulfur and NOx fluxes over grassland, 12:37648 (R;US)

**RANKINE CYCLE ENGINES**
**Test Facilities**
Predicting toluene degradation in organic Rankine-cycle engines, 12:37527 (R;US)
**Working Fluids**
Predicting toluene degradation in organic Rankine-cycle engines, 12:37527 (R;US)
**RARE EARTHS**
*See also DYSPROSIUM*
**Abundance**
Trace rare earth element analysis in briny groundwaters, 12:38045 (R;US)
**Solvent Extraction**
Chelating extractants of improved selectivity: Final report, 12:37373 (R;US)
**RASCHIG RINGS**
*See COLUMN PACKING*
**RATS**
**Respiration**
Effect of continuous positive and negative pressure breathing on the respiratory pattern of conscious rats, 12:37885 (RA;US)
**RDF**
*See REFUSE DERIVED FUELS*
**REACTOR ACCIDENTS**
*See also LOSS OF COOLANT*
*MELTDOWN*
*REACTOR CORE DISRUPTION*
**Aerosols**
Influence of moisture on the behavior of aerosols, 12:36898 (RA;US)
Results from DEMONA aerosol experiments, 12:36902 (RA;US)
Summary of aerosol code-comparison results for LWR aerosol containment tests LA1, LA2, and LA3, 12:36900 (RA;US)
**C Codes**
Integrated ex-vessel source term analysis with the CONTAIN 1.1 computer code, 12:36901 (RA;US)
**Computer Codes**
Summary of aerosol code-comparison results for LWR aerosol containment tests LA1, LA2, and LA3, 12:36900 (RA;US)
**Containment Systems**
LWR aerosol containment experiments (LACE) program summary and preliminary observations, 12:36899 (RA;US)
**Data Base Management**
Update on standard problem, data base, and uncertainties, 12:36897 (RA;US)
**Data Compilation**
Report to the US Nuclear Regulatory Commission on Analysis and Evaluation of Operational Data, 1986, 12:36836 (R;US)
**Emergency Plans**
NRC Incident Response Plan, 12:36833 (R;US)
**Environmental Effects**
Radioactivity in foods - Chernobyl and the consequences, 12:37817 (R;DE;In German)
**Explosions**
Steam explosion energetics, 12:36914 (RA;US)
**Fluid-Structure Interactions**
Proceedings of the Committee on the Safety of Nuclear Installations (CSNI) specialists' meeting on core debris-concrete interactions, 12:36826 (R;US)
**Human Factors**
Accident Sequence Evaluation Program: Human reliability analysis procedure, 12:36925 (R;US)
**Hydrogen**
Recent results in hydrogen research, 12:36915 (RA;US)
**M Codes**
MELCOR validation and verification: 1986 papers, 12:36927 (R;US)
**Reactor Core Disruption**
Results from DEMONA aerosol experiments, 12:36902 (RA;US)
Steam explosion energetics, 12:36914 (RA;US)
Thermal-hydraulic studies on molten core-concrete interactions, 12:36903 (RA;US)
**Source Terms**
Integrated ex-vessel source term analysis with the CONTAIN 1.1 computer code, 12:36901 (RA;US)
QUASAR uncertainty study, 12:36905 (RA;US)
**System Failure Analysis**
Using operating experience and a cause coding tree to identify improvements for nuclear process control, 12:36825 (R;US)
**REACTOR COMPONENTS**
*See also FUEL ELEMENTS*
*REACTOR COOLING SYSTEMS*
*REACTOR CORES*
**Aging**
US Department of Energy Nuclear Plant Life Extension Program, 12:36929 (R;US)
**Fasteners**
Seismic verification of nuclear plant equipment anchorage: Volume 1, Development of anchorage guidelines: Final report, 12:36827 (R;US)
Seismic verification of nuclear plant equipment anchorage: Volume 2, Anchorage inspection workbook: Final report, 12:36828 (R;US)
**Heat Pipes**
Performance correlations for high temperature potassium heat pipes, 12:36803 (R;US)
**Lifetime**
The identification and monitoring of critical components for nuclear life extension, 12:36806 (R;US)
**Monitoring**
The identification and monitoring of critical components for nuclear life extension, 12:36806 (R;US)
**Restraints**
Seismic verification of nuclear plant equipment anchorage: Volume 1, Development of anchorage guidelines: Final report, 12:36827 (R;US)
Seismic verification of nuclear plant equipment anchorage: Volume 2, Anchorage inspection workbook: Final report, 12:36828 (R;US)
**Welded Joints**
Seismic verification of nuclear plant equipment anchorage: Volume 1, Development of anchorage guidelines: Final report, 12:36827 (R;US)
Seismic verification of nuclear plant equipment anchorage: Volume 2, Anchorage inspection workbook: Final report, 12:36828 (R;US)
**REACTOR CONTROL SYSTEMS**
**Computerized Simulation**
Analysis of the start-up and control of a particle bed reactor, 12:36779 (R;US)
**Signals**
Signal validation in nuclear power plants: Progress report No. 1, 12:36812 (R;US)
**REACTOR COOLING SYSTEMS**
*See also PRIMARY COOLANT CIRCUITS*
*RHR SYSTEMS*
**Natural Convection**
RCS natural circulation in a PWR station blackout accident--an application of NRC mechanistic codes, 12:36906 (RA;US)
**Repair**
Origin of spurious ultrasonic echoes in stainless steel piping with weld overlay, 12:36775 (BA;US)
**REACTOR CORE DISRUPTION**
**C Codes**
Development and applications of the interim direct heating model for the CONTAIN computer code, 12:36912 (RA;US)
**Computerized Simulation**
Development and applications of the interim direct heating model for the CONTAIN computer code, 12:36912 (RA;US)
**M Codes**
MELPROG/TRAC: update and applications, 12:36907 (RA;US)
**R Codes**
SCDAP/RELAP5 update and applications, 12:36908 (RA;US)
**S Codes**
SCDAP/RELAP5 update and applications, 12:36908 (RA;US)
**Simulation**
DCH-1: first direct containment heating experiment in the SURTSEY test facility, 12:36910 (RA;US)
**T Codes**
MELPROG/TRAC: update and applications, 12:36907 (RA;US)

**REACTOR CORES**
*See also HETEROGENEOUS REACTOR CORES*
**Design**
Thermal-hydraulic considerations for particle bed reactors, 12:36781 (R;US)
**REACTOR DECOMMISSIONING**
**Cutting Tools**
Hot tests of the small portable arc saw using an electromechanical manipulator, 12:36935 (BA;US)
**REACTOR FUEL ELEMENTS**
*See FUEL ELEMENTS*
**REACTOR INSTRUMENTATION**
**Aging**
Degradation of nuclear plant temperature sensors, 12:36774 (R;US)
**Performance Testing**
Degradation of nuclear plant temperature sensors, 12:36774 (R;US)
**REACTOR MATERIALS**
*To be assigned in conjunction with the specific descriptor for the material used in a reactor, provided this descriptor is not yet up-posted to reactor materials.*
Laboratory evaluations of cobalt-free, nickel-based hard-facing alloys for nuclear applications: Topical report, 12:37219 (R;US)
**Embrittlement**
Design and use of the Embrittlement Data Base (EDB), 12:36802 (R;US)
**Materials Testing**
Tests of candidate materials for particle bed reactors, 12:36780 (R;US)
**Physical Radiation Effects**
Design and use of the Embrittlement Data Base (EDB), 12:36802 (R;US)
**REACTOR OPERATION**
*See also REACTOR START-UP*
**Compiled Data**
Licensee event report (LER) compilation for month of January 1987, 12:36795 (R;US)
**Data Compilation**
Licensee event report (LER) compilation: For month of April 1987, 12:36797 (R;US)
Licensee event report (LER) compilation for month of February 1987, 12:36796 (R;US)
**REACTOR OPERATORS**
**Reliability**
Accident Sequence Evaluation Program: Human reliability analysis procedure, 12:36925 (R;US)
**Training**
Emergency response training with the BNL plant analyzer, 12:36811 (R;US)
**REACTOR SAFETY**
**R Codes**
RELAP5/MOD2 development, 12:36866 (RA;US)
Swedish experience with RELAP5/MOD2 assessment, 12:36874 (RA;US)
**Research Programs**
List of reports in the field of reactor safety research sponsored by BMFT, CEA, EPRI, JSTA and USNRC. Reported period: October 1-December 31, 1986. Progress report, 12:36830 (R;DE;In German)
Nuclear safety—forward on technology and backward on perception, 12:36889 (RA;US)
Role of oversight within NRR and its effect on industry, 12:36893 (RA;US)
**T Codes**
Status of the TRAC-BWR Program, 12:36865 (RA;US)
TRAC code development status and plans, 12:36867 (RA;US)
**REACTOR SHUTDOWN**
**Data Compilation**
Analysis of balance-of-plant regulatory issues: Final report, 12:36926 (R;US)
**REACTOR START-UP**
**Computerized Simulation**
Analysis of the start-up and control of a particle bed reactor, 12:36779 (R;US)
**READOUT SYSTEMS**
Accurate 2 dimensional drift tube readout using time division and vernier pads, 12:37571 (J;NL)
**RECEIVERS (SOLAR)**
*See SOLAR RECEIVERS*
**RECHARGE**
**Water Wells**
Source of gross-alpha radioactivity anomalies in recharge wells, central Florida phosphate district. Final report, 12:37851 (R;US)
**RECIPROCAL TRANSLOCATIONS**
*See CHROMOSOMAL ABERRATIONS*
**RECLAMATION**
*See LAND RECLAMATION*
**RECREATIONAL VEHICLES**
*See also MOTORBOATS*
**Motorboats**
Report to Congress on the gasoline excise-tax revenues attributable to fuel used in recreational motorboats, 12:36955 (R;US)
**RECYCLING**
**Economics**
The economic feasibility of plastics recycling, 12:37129 (R;US)
**RECYCLING (FUEL)**
*See REPROCESSING*
**REDUCTASES**
*See OXIDOREDUCTASES*
**REDUCTION**
*For chemical reactions only.*
**Catalysts**
The study of some transition metals complexes as process catalysts: Quarterly report for the period March 1, 1987 through May 31, 1987, 12:36265 (R;US)
**REFORMER PROCESSES**
*See also STEAM REFORMER PROCESSES*
**Catalysts**
Peat-bio-gasification. Progress report stage 8 1985-07-01-1986-06-30, 12:36277 (R;SE;In Swedish)
**REFRIGERATORS**
*See also SOLAR REFRIGERATORS*
**Compressors**
Efficient refrigerators with small compressors, 12:37075 (R;DK;In Danish)
**Energy Consumption**
Energy use test procedures for appliances: A case study of Japanese refrigerators, 12:37027 (R;US)
**Energy Efficiency**
Energy efficiency choice in the purchase of residential appliances, 12:37097 (BA;US)
Energy use test procedures for appliances: A case study of Japanese refrigerators, 12:37027 (R;US)
**Market**
Energy efficiency choice in the purchase of residential appliances, 12:37097 (BA;US)

**Research Programs**
Compact reactor studies: Technical progress report, 1 December 1986 through 30 November 1987, 12:38377 (R;US)
**Reverse-Field Pinch**
Compact reactor studies: Technical progress report, 1 December 1986 through 30 November 1987, 12:38377 (R;US)
**RESEARCH PROGRAMS**
*To be used jointly with descriptor(s) for subject field and/or organization concerned.*
**Catalogs**
National Register of research projects: Part 1, Natural sciences: Biological, medical and related sciences, 12:38397 (R;ZA;In Afrikaans and English)
**RESERVE CAPACITY**
*See CAPACITY*
**RESERVOIR ROCK**
**Density**
The GRI staged field experiment, 12:36440 (BA;US)
**Fracture Properties**
Gas recovery from deep millidarcy layered gas formations with nonlinear elastic deformation characteristics, 12:36443 (BA;US)
Pressure transient response in multilayer gas reservoirs containing hydraulic fractures, 12:36455 (BA;US)
The influence of fracture toughness on the geometry of hydraulic fractures, 12:36394 (BA;US)
**Gas Flow**
The effect of pore structure on non-Darcy gas flow in some low-permeability reservoir rocks, 12:36433 (BA;US)
**Gas Saturation**
Recovery efficiency aspects of horizontal well drilling in Devonian shale, 12:36434 (BA;US)
**Hydraulic Conductivity**
New methods for estimating parameters of low permeability reservoirs, 12:36407 (BA;US)
**Hydraulic Fractures**
Realistic fracture conductivities of proppants as a function of reservoir temperature, 12:36389 (BA;US)
**Lithology**
The effects of lithology and reservoir pressure on the in-situ stresses in the Waskom (Travis Peak) field, 12:36454 (BA;US)
**Mathematical Models**
Reservoir properties required for profitable stimulations, 12:36450 (BA;US)
**Measuring Methods**
Reliability of laboratory measurement of porosity in tight gas sands, 12:36432 (BA;US)
**Microstructure**
The effect of pore structure on non-Darcy gas flow in some low-permeability reservoir rocks, 12:36433 (BA;US)
**Permeability**
Low-permeability reservoirs development using horizontal wells, 12:36402 (BA;US)
Reservoir properties required for profitable stimulations, 12:36450 (BA;US)
The effect of pore structure on non-Darcy gas flow in some low-permeability reservoir rocks, 12:36433 (BA;US)
The GRI staged field experiment, 12:36440 (BA;US)
**Porosity**
Reliability of laboratory measurement of porosity in tight gas sands, 12:36432 (BA;US)
Reservoir properties required for profitable stimulations, 12:36450 (BA;US)
The effect of pore structure on non-Darcy gas flow in some low-permeability reservoir rocks, 12:36433 (BA;US)
**Pressure Effects**
The effects of lithology and reservoir pressure on the in-situ stresses in the Waskom (Travis Peak) field, 12:36454 (BA;US)
**Pressure Gradients**
Pressure transient response in multilayer gas reservoirs containing hydraulic fractures, 12:36455 (BA;US)
**Rock-Fluid Interactions**
Mechanisms controlling fracture height growth in layered media, 12:36392 (BA;US)
Realistic fracture conductivities of proppants as a function of reservoir temperature, 12:36389 (BA;US)
**Stress Analysis**
In-situ stresses in low-permeability, nonmarine rocks, 12:36404 (BA;US)
The effects of lithology and reservoir pressure on the in-situ stresses in the Waskom (Travis Peak) field, 12:36454 (BA;US)

**Aerosol Monitoring**
Study on indoor air impurities, 12:37089 (R;FI;In Finnish)
**Air Heaters**
Heat pump in a block of flats with warm air heating, 12:37095 (R;FI;In Finnish)

**Building Codes**
Energy conservation business opportunities in multifamily housing: Energy-efficient manufactured housing in Chicago: Part 2, Building code, construction and energy efficiency issues: [Final report], 12:37064 (R;US)
Energy conservation business opportunities in multifamily housing: Energy-efficient manufactured housing in Chicago: Part 3, Building code and energy efficiency appendices: [Final report], 12:37065 (R;US)
**Construction**
Energy conservation business opportunities in multifamily housing: Energy-efficient manufactured housing in Chicago: Part 2, Building code, construction and energy efficiency issues: [Final report], 12:37064 (R;US)
**Electric Heating**
Impact of electric space-heating on comfort of living. Literature study, 12:37071 (R;FI;In Finnish)
Occupant influence on energy consumption in single-family dwellings, 12:37019 (R;SE)
**Energy Conservation**
Energy conservation business opportunities in multifamily housing: Executive summary and conclusions: [Final report], 12:37061 (R;US)
Energy conservation business opportunities in multifamily housing: Feasibility analysis/business plan for proposed residential balancing venture: [Final report], 12:37062 (R;US)
**Energy Consumption**
Occupant influence on energy consumption in single-family dwellings, 12:37019 (R;SE)
**Energy Efficiency**
Energy conservation business opportunities in multifamily housing: Energy-efficient manufactured housing in Chicago: Part 2, Building code, construction and energy efficiency issues: [Final report], 12:37064 (R;US)
Energy conservation business opportunities in multifamily housing: Energy-efficient manufactured housing in Chicago: Part 1, Industry assessment and business concept paper: [Final report], 12:37063 (R;US)
**Energy Efficiency Standards**
Energy conservation business opportunities in multifamily housing: Energy-efficient manufactured housing in Chicago: Part 3, Building code and energy efficiency appendices: [Final report], 12:37065 (R;US)
**Heat Pumps**
Heat pump in a block of flats with warm air heating, 12:37095 (R;FI;In Finnish)
Projecting market demand for residential heat pumps, 12:37018 (R;US)
**Heating Systems**
1985 primary heating fuel use and switching: Assessment of the market for conservation in the Northwest: Phase 2, 12:37080 (R;US)
Energy conservation business opportunities in multifamily housing: Feasibility analysis/business plan for proposed residential balancing venture: [Final report], 12:37062 (R;US)
Evaluation of gas heating system retrofit pilot programs in Minnesota and Kentucky, 12:37026 (R;US)
**Indoor Air Pollution**
Some results from the demonstration of indoor radon reduction measures in block basement houses. Report for June 1985-February 1987, 12:37720 (R;US)
Statistical aspects of autoregressive models in the assessment of radon mitigation, 12:37717 (R;US)
Study on indoor air impurities, 12:37089 (R;FI;In Finnish)
**Monitoring**
Weatherization assistance program: Final monitoring report for Arizona; California; the Navajo Nation; Nevada, 12:37067 (R;US)
**Solar Water Heating**
A design method for thermosyphon solar domestic hot water systems, 12:36688 (J;US)
**Weatherization**
Energy conservation business opportunities in multifamily housing: Executive summary and conclusions: [Final report], 12:37061 (R;US)
Weatherization assistance program: Final monitoring report for Arizona; California; the Navajo Nation; Nevada, 12:37067 (R;US)
**RESIDENTIAL SECTOR**
**Energy Conservation**
Overview of the heat loss study for the Hood River Conservation Project, 12:37060 (RA;US)
Technology diffusion of energy-related products in residential markets, 12:37081 (R;US)
**Energy Consumption**
Trends in consumption and expenditures, 1978-1984: Residential Energy Consumption Survey, 12:37002 (R;US)
**Energy Expenses**
Thermal and cost comparison of six superinsulated houses and one passive solar house in the Idaho residential demonstration program, 12:37045 (RA;US)
Trends in consumption and expenditures, 1978-1984: Residential Energy Consumption Survey, 12:37002 (R;US)

**SILANES**
**Chemical Reaction Kinetics**
A solid state multinuclear magnetic resonance study of the sol-gel process using polysilicate precursors, 12:37318 (BA;US)
Studies of the initial steps in sol-gel processing of Si(OR)/sub 4/: /sup 29/Si NMR of alkoxysilane and alkoxysiloxane solutions, 12:37317 (BA;US)
Theoretical modeling and laser diagnostics of silicon chemical vapor deposition, 12:37430 (B;US)
**Chemical Vapor Deposition**
Theoretical modeling and laser diagnostics of silicon chemical vapor deposition, 12:37430 (B;US)

**Hydrolysis**
Studies of the initial steps in sol-gel processing of Si(OR)/sub 4/: /sup 29/Si NMR of alkoxysilane and alkoxysiloxane solutions, 12:37317 (BA;US)
**Ion-Molecule Collisions**
The free-radical and ion chemistry of volatile silanes, germanes and phosphines: Annual informal technical report, November 1, 1986-May 31, 1987, 12:37432 (R;US)
**Mathematical Models**
Theoretical modeling and laser diagnostics of silicon chemical vapor deposition, 12:37430 (B;US)
**Nuclear Magnetic Resonance**
A solid state multinuclear magnetic resonance study of the sol-gel process using polysilicate precursors, 12:37318 (BA;US)
**Phase Transformations**
Theoretical modeling and laser diagnostics of silicon chemical vapor deposition, 12:37430 (B;US)
**Photochemical Reactions**
The free-radical and ion chemistry of volatile silanes, germanes and phosphines: Annual informal technical report, November 1, 1986-May 31, 1987, 12:37432 (R;US)
**Sol-Gel Process**
A solid state multinuclear magnetic resonance study of the sol-gel process using polysilicate precursors, 12:37318 (BA;US)
Studies of the initial steps in sol-gel processing of Si(OR)/sub 4/: /sup 29/Si NMR of alkoxysilane and alkoxysiloxane solutions, 12:37317 (BA;US)
**Thermal Degradation**
Theoretical modeling and laser diagnostics of silicon chemical vapor deposition, 12:37430 (B;US)

**SILICA**
**Air Flow**
Effects of low velocity air flow over alumina-silica insulating boards in solar environments, 12:36673 (BA;US)
**Brittleness**
Packing-induced brittleness in polyimide- and aluminum-clad fused-silica capillaries, 12:37358 (J;US)
**Catalytic Effects**
Transient temperature technique applied to study activity pattern changes during the hydrogenation of CO over nickel/silica catalysts, 12:36594 (J;US)
**Chemical Reaction Kinetics**
Kinetic investigations of alkoxysilane sol-gel processing, 12:37312 (BA;US)
Reactivity of silicates 1. Kinetic studies of the hydrolysis of linear and cyclic siloxanes as models for defect structure in silicates, 12:37427 (BA;US)
**Computerized Simulation**
Growth and structure of fractally rough silica colloids, 12:37429 (BA;US)
**Crystal Growth**
Growth and structure of fractally rough silica colloids, 12:37429 (BA;US)
**Hydrolysis**
Growth and structure of fractally rough silica colloids, 12:37429 (BA;US)
Reactivity of silicates 1. Kinetic studies of the hydrolysis of linear and cyclic siloxanes as models for defect structure in silicates, 12:37427 (BA;US)
**Molecular Structure**
Growth and structure of fractally rough silica colloids, 12:37429 (BA;US)
**Polymerization**
Fractal aspects of ceramic synthesis, 12:37321 (BA;US)
**Sol-Gel Process**
Kinetic investigations of alkoxysilane sol-gel processing, 12:37312 (BA;US)

Use of isopropanol to distinguish $H_2SO_4$ from particulate sulfate on filters, 12:37656 (R;US)

**SUNSPOTS**
Solar-Geophysical Data Number 510, February 1987. Part 1 (prompt reports). Data for January 1987, December 1986, and late data, 12:38065 (R;US)
**Statistical Data**
Sunspot numbers: 1610-1985 based on The Sunspot-Activity in the Years 1610-1960', 12:38067 (R;US)

**SUPERALLOYS**
*See HEAT RESISTING ALLOYS*

**SUPERCOMPUTERS**
**Algorithms**
Algorithm implementation on the Navier-Stokes computer, 12:37495 (R;US)
**Computer Calculations**
Modelling and scale-up of chemical flooding: First annual report for the period October 1985-September 1986, 12:36379 (R;US)
**Parallel Processing**
Performance evaluation of parallel branch and bound search with the Intel IPSC (Intel Personal Supercomputer) hypercube computer. Master's thesis, 12:38403 (R;US)
**Uses**
Quantum chemical methods for massively parallel computers, 12:38308 (R;US)

**SUPERCONDUCTING COILS**
Superconducting augmented rail gun (SARG). Final technical report, 12:37528 (R;US)

**SUPERCONDUCTING COMPOSITES**
**Electric Conductivity**
Investigation of heavy fermion and dense Kondo systems in Ce-based ternary silicides, 12:37337 (R;US)
**Magnetic Susceptibility**
Investigation of heavy fermion and dense Kondo systems in Ce-based ternary silicides, 12:37337 (R;US)
**Transition Temperature**
Superconductivity, magnetism, and charge density wave formation in ternary compounds with the $Sc_5Co_4Si_{10}$-type structure, 12:37338 (R;US)

**SUPERCONDUCTING FILMS**
**Magnetic Shielding**
Annihilation of vortex-antivortex pairs in a superconducting shield, 12:37458 (R;US)

**SUPERCONDUCTING JUNCTIONS**
*See also JOSEPHSON JUNCTIONS*
**Energy Beam Deposition**
Superconducting thin films, composites & junctions. Annual report, 1 October 1985-30 September 1986, 12:37450 (R;US)
**Tunnel Effect**
SIS (superconductor-insulator-superconductor) mixer research. Final report, 15 November 1985-14 November 1986, 12:37452 (R;US)

**SUPERCONDUCTING SUPER COLLIDER**
**Site Selection**
Geological-geotechnical studies for siting the Superconducting Super Collider in Illinois: results of the Fall 1984 test-drilling program. Environmental geology notes, 12:37562 (R;US)

**SUPERCONDUCTING WIRES**
**Current Density**
Importance of spacing in the development of high current densities in multifilamentary superconductors, 12:37255 (J;GB)

**SUPERCONDUCTIVITY**
Heavy electron superconductivity: From 1K to 90K to ?, 12:38306 (R;US)

**SUPERCONDUCTORS**
**Impurities**
Superconducting electronic-film structures. Annual report, 1 January-31 December 1986, 12:37325 (R;US)
**Low Temperature**
Switching phenomena in a new 90-K superconductor, 12:37359 (J;GB)
**Magnetic Properties**
Switching phenomena in a new 90-K superconductor, 12:37359 (J;GB)

**Physical Radiation Effects**
The influence of N-ion irradiation on superconducting TiN, 12:37212 (R;US)
**Thin Films**
Superconducting electronic-film structures. Annual report, 1 January-31 December 1985, 12:37448 (R;US)
**SUPERCRITICAL FLOW**
*See TURBULENT FLOW*
**SUPERFUND**
Soil-gas measurement for detection of subsurface organic contamination, 12:37810 (R;US)
**Manuals**
Superfund public health evaluation manual, 12:37892 (R;US)
**Program Management**
Superfund innovative technology evaluation (site) strategy and program plan, 12:37811 (R;US)
**Remedial Action**
Superfund federal-lead remedial project-management handbook. Final report, 12:37812 (R;US)
Superfund state-lead remedial project-management handbook. Final report, 12:37813 (R;US)
**Technology Utilization**
Annual report to the Congress, Fiscal Year 1986 (Office of Technology Assessment), 12:36973 (R;US)
**Waste Processing**
Superfund treatment technologies: a vendor inventory, 12:37814 (R;US)
**SUPERLATTICES**
**Neutron Diffraction**
Artific al magnetic superlattices, 12:38295 (R;US)
**SUPERNOVAE**
Supernovae and high density nuclear matter, 12:38285 (BA;DE)
**Measuring Methods**
Program of ground-based astronomy to complement Einstein observations. Final report, 1 October 1981-30 September 1986, 12:38050 (R;US)
**SUPERSYMMETRY**
**String Models**
Fate of the m/sub b//m/sub tau/ mass relation in superstring theories, 12:38202 (J;NL)
**Testing**
Ir(t-arrow-right,$\alpha$)Os reaction and implications for tests of supersymmetries, 12:38262 (J;US)

Tritons and tritides as the solute and diffusing species in ceramic tritium breeders, 12:38370 (R;US)
**Coordinated Research Programs**
Nuclear fusion project. Semi-annual report of the Association KfK/EURATOM. April 1986-September 1986, 12:38381 (R;DE)
**Risk Assessment**
Fusion Safety Program annual report: Fiscal year 1986, 12:38378 (R;US)
**Safety**
Fusion Safety Program annual report: Fiscal year 1986, 12:38378 (R;US)
**THERMONUCLEAR WEAPONS**
*See NUCLEAR WEAPONS*
**THERMOPLASTICS**
**Aging**
Assessment of methods for characterization of polyolefin dielectrics, 12:37367 (BA;US)
**Dielectric Properties**
Assessment of methods for characterization of polyolefin dielectrics, 12:37367 (BA;US)
**Failure Mode Analysis**
Assessment of methods for characterization of polyolefin dielectrics, 12:37367 (BA;US)
**THF**
*See TETRAHYDROFURAN*
**THICKNESS**
*Index only if essential.*
**Measuring Methods**
Automated system for assessing the cladding thickness and bond integrity of tubular nuclear fuel elements, 12:36810 (R;US)
**THIN FILMS**
**Bragg Reflection**
An experimental measurement of metal multilayer x-ray reflectivity degradation due to intense x-ray flux, 12:38298 (R;US)
**Superconducting Junctions**
Superconducting thin films, composites & junctions. Annual report, 1 October 1985-30 September 1986, 12:37450 (R;US)
**X Codes**
An experimental measurement of metal multilayer x-ray reflectivity degradation due to intense x-ray flux, 12:38298 (R;US)
**THIO COMPOUNDS**
*See ORGANIC SULFUR COMPOUNDS*
**THIOPHENE**
**Adsorption**
Surface chemistry of model Co-Mo catalysts supported on planar g-Al/sub 2/O/sub 3/: Quarterly technical progress report for period March 1, 1987 to May 31, 1987, 12:36268 (R;US)
**Biodegradation**
Isolation and genetic analysis of mutations allowing the degradation of furans and thiophenes by Escherichia coli, 12:37870 (J;US)
**Electric Impedance**
Impedance and electroreflectance of reduced poly (3-methyl thiophene)-P3MT in an aqueous electrolyte: Direct observation of a polaron transition, 12:36642 (J;US)
**Reflectivity**
Impedance and electroreflectance of reduced poly (3-methyl thiophene)-P3MT in an aqueous electrolyte: Direct observation of a polaron transition, 12:36642 (J;US)
**THIOPHENES**
*See POLYCYCLIC SULFUR HETEROCYCLES*
**THIOSORBIC PROCESS**
**Air Pollution Abatement**
Evaluation of solids dewatering for a pilot-scale thiosorbic lime $SO_2$ scrubber. Report for September 1985-April 1986, 12:37653 (R;US)
**THOMASON COLLECTORS**
*See TRICKLE-TYPE COLLECTORS*
**THORAX**
*See CHEST*
**THORIUM 230 TARGET**
**Neutron Reactions**
Coriolis interaction and variable reflection asymmetry in fission vibrational resonances, 12:38277 (J;US)
**THORIUM ALLOYS**
**Specific Heat**
Specific heat of (U/sub 0.97/Th/sub 0.03/)$Be_{13}$ under pressure, 12:37228 (R;US)
**Spectra**
Understanding photoemission spectra in uranium based heavy fermion systems, 12:37204 (R;US)
**THORIUM B**
*See LEAD 212*
**THORIUM D**
*See LEAD 208*
**THORIUM OXIDES**
**Catalytic Effects**
Production of methanol and light hydrocarbons on $ThO_2$ and doped-$ThO_2$ from CO + $H_2$ mixtures, 12:36603 (R;US)
**Toxicity**
Influence of heterogeneous alpha irradiation of Chinese hamster liver on the induction of cancer. II, 12:37927 (RA;US)
**THORON**
*See RADON 220*
**THREE MILE ISLAND-2 REACTOR**
*Dauphin County, Pennsylvania, USA*
**Corium**
TMI-2 lower vessel debris examinations, 12:36894 (RA;US)
**Meltdown**
Lessons learned from hydrogen generation and burning during the TMI-2 event, 12:36829 (R;US)
**Molten Metal-Water Reactions**
Lessons learned from hydrogen generation and burning during the TMI-2 event, 12:36829 (R;US)
**Reactor Accidents**
Experimental study of isothermal and boiling liquid jets, 12:36913 (RA;US)
Preliminary results of the TMI-2 core bores, 12:36895 (RA;US)
TMI-2 accident scenario update, 12:36896 (RA;US)
TMI-2 lower vessel debris examinations, 12:36894 (RA;US)
Update on standard problem, data base, and uncertainties, 12:36897 (RA;US)
**THRESHOLD DETECTORS**
**Performance**
Data collection and presentation procedures for the US Army's Chemical Hazard Assessment Warning System (CHAWS), 12:37706 (R;US)
**THULIUM 149**
**Beta-Plus Decay**
Observation of /sup 149/Tm decay to /sup 149/Er levels and $\beta$-delayed proton emission, 12:38253 (J;US)
**TIBET**
**Meteorology**
Tibet revisited: TIPMEX-86, 12:37725 (J;US)
**TIDAL POWER**
**Estuaries**
Preliminary survey of tidal energy of U.K. estuaries, 12:36732 (R;GB)

**TIDAL POWER PLANTS**
**Feasibility Studies**
Proposal of a floating tide power plant in Vestmannasund, 12:36734 (R;DK;In Danish)
**TIN**
**Energy-Level Density**
Density-of-states calculations within the recursion method, 12:38303 (J;US)
**Superconducting Junctions**
Superconducting electronic-film structures. Annual report, 1 January-31 December 1985, 12:37448 (R;US)
**TIN ALLOYS**
**Superconductivity**
Superconducting electronic-film structures. Annual report, 1 January-31 December 1986, 12:37325 (R;US)
**TIN ISOTOPES**
**Beta-Plus Decay**
Towards /sup 100/Sn: Studies on neutron-deficient even isotopes of tin, 12:38252 (R;DE)

Progress in the image analysis of tree rings, 12:38033 (RA;US)
**Inventories**
Environmental stresses and residual variation in European tree-ring data after climatic influence is removed, 12:38030 (RA;US)
**Isotope Dating**
Influence of site disturbance on $\delta^{13}C$ isotopic time series from tree rings, 12:38019 (RA;US)
**Mapping**
Tree-ring reconstruction of Indian-Cree tree harvesting in the area, Quebec, Poste-de-la-Baleine, 12:38029 (RA;US)
**Mathematical Models**
Disaggregation of tree-ring series for environmental studies, 12:37758 (RA;US)
Tree-growth, ARMA modelling and pollution, 12:37955 (RA;US)
**Measuring Methods**
Method to obtain thin cross-sections for tree-ring analysis, 12:38036 (RA;US)
**Time-Series Analysis**
History of the chemical environment from elemental analysis of tree rings, 12:37956 (RA;US)
Influence of site disturbance on $\delta^{13}C$ isotopic time series from tree rings, 12:38019 (RA;US)
Intervention detection - a systematic technique for examining shifts in radial growth rates of forest trees, 12:37858 (RA;US)
Potential in using elemental concentrations in radial increments of old growth eastern red cedar to examine the chemical history of the environment, 12:38035 (RA;US)
Some applications of the Kalman filter to tree-ring analysis, 12:37760 (RA;US)
Time-series analysis applied to tree-ring series, 12:37759 (RA;US)
**Variations**
Cypress tree-ring analysis in relation to wetlands and hydrology (Taxodium distichum), 12:37832 (RA;US)
Dating earthquakes along the San Andreas fault system in California, 12:37752 (RA;US)
Dendrochronological study of oak trunks found in bogs in northwest Germany, 12:38025 (RA;US)
Forest disturbance and tree-ring analysis, 12:37744 (RA;US)
Late Holocene sediment yield and transport in a northern Arizona drainage basin reconstructed by tree-ring analysis, 12:38020 (RA;US)
Potential for use of cottonwoods as indicators of past floods, 12:37831 (RA;US)
Southern forest growth trends: air pollution influence studies and tree-ring analysis, 12:37943 (RA;US)
Tree-ring studies and the reconstruction of woodland management practices in antiquity, 12:38027 (RA;US)
Tree-rings and insects: the influence of cockchafers on the development of growth rings in oak trees, 12:37745 (RA;US)
Western spruce budworm outbreaks in northern New Mexico: tree-ring evidence of occurrence and radial growth impacts from 1700 to 1983, 12:37883 (RA;US)
**Width**
Dendroecological analysis of a population of black gum (Nyssa sylvatic Marsh.) in southern Ontario, Canada, 12:37740 (RA;US)
Disaggregation of tree-ring series for environmental studies, 12:37758 (RA;US)
Environmental stresses and residual variation in European tree-ring data after climatic influence is removed, 12:38030 (RA;US)
Management effects in British tree-ring series, 12:37757 (RA;US)
Method to obtain thin cross-sections for tree-ring analysis, 12:38036 (RA;US)
Network of high elevation conifers in the western US for detection of tree-ring growth response to increasing atmospheric carbon dioxide, 12:37950 (RA;US)
Productivity in fossil forests, 12:38026 (RA;US)

Radiodensitometric tree-ring along altitudinal gradients: some alternative procedures for detecting site, climatic, and potential $CO_2$ effects on tree growth, 12:37949 (RA;US)
Recent abnormal increase in tree-ring widths: a possible effect of elevated atmospheric carbon dioxide, 12:37953 (RA;US)
Time-dependent responses of trees to weather variations an application of the Kalman filter, 12:37954 (RA;US)

## V

**V CODES**
VAWT stochastic wind simulator, 12:36742 (R;US)

**VA CHARACTERISTIC**
*See ELECTRIC CONDUCTIVITY*

**VALVES**
**Design**
Coal slurry letdown device, 12:36255 (RA;US)
Slurry valve development, 12:36246 (RA;US)
**Electroslag Casting**
Electroslag component casting, 12:36250 (RA;US)
**Performance Testing**
Coal slurry letdown device, 12:36255 (RA;US)
Slurry valve development, 12:36246 (RA;US)

**VANADIUM 51 TARGET**
**Carbon 12 Reactions**
Statistical GDR [Giant Dipole Resonances] decay of highly excited states of $^{63}$Cu, 12:38244 (R;US)
**Hypernuclei**
Studies of hypernuclei by associated production, 12:38237 (R;US)
**Pion Plus Reactions**
Studies of hypernuclei by associated production, 12:38237 (R;US)

**VANADIUM ALLOYS**
*See also ALLOY-IN-100*
**Fracture Properties**
Influence of microstructure and microdamage processes on fracture at high loading rates. Annual report No. 1, February 1986-January 1987, 12:37199 (R;US)
**Shot Peening**
Shot peening for Ti-6Al-4V alloy compressor blades, 12:37229 (R;US)

**VANADIUM MINERALS**
*See MINERALS*

**VANADIUM OXIDES**
**Catalytic Effects**
Solid state, surface and catalytic properties of oxides: Final report, 12:37392 (R;US)

**VECTOR PROCESSING**
Vector-array-processor computer equipment. Final report, 1 January-31 December 1985, 12:38052 (R;US)

**Computer Architecture**
Performance comparison of four state-of-the-art computer architectures. Master's thesis, 12:38401 (R;US)

**VECTORS**
Architectural implications of a parallel-computational approach to the vector-wave equation. Master's thesis, 12:38307 (R;US)

**VEGETABLE OILS**
*Prior to March 1983 this concept was indexed to PLANTS and OILS.*
*See also SOYBEAN OIL*
**Chemical Preparation**
Stability and composition of palm, coconut and soy oil fatty acid microemulsion diesel fuels, 12:36605 (BA;US)

**VEGETATION**

**Air Pollution**
Pollution from motor vehicles and aircraft at Stapleton International Airport (abbreviated report), 12:37599 (R;US)
**Brakes**
In-depth survey report: control technology for brake-drum service operations at Ohio Department of Transportation, Maintenance Facility, Lebanon, Ohio, 12:37685 (R;US)
**Data Transmission**
Vehicle tracking systems, 12:38396 (R;US)
**Exhaust Gases**
User's guide to the TEXIN2 model--a model for predicting carbon monoxide concentrations near intersections. Interim research report, September 1979-August 1986, 12:37184 (R;US)
**Monitoring**
A neutron portal monitor for vehicles, 12:36562 (R;US)
**Navigation**
Vehicle tracking systems, 12:38396 (R;US)
**Refrigeration**
Potential of the tractor-trailer and container segments as entry markets for a proposed refrigeration technology, 12:37103 (R;US)
**Traffic Control**
Full and fractional stop costs and traffic stream performance during speed change cycles. Technical report, 12:37102 (R;ZA)

**VENTILATION SYSTEMS**
**Air Flow**
Test equipment system to study the dynamics and the controlability of air conditioning processes, 12:37082 (R;FI;In Finnish)
**Air Quality**
Indoor particle concentration and the outdoor to indoor transport. Part 3. Effects of airconditioning systems, 12:37088 (R;FI;In Finnish)
**Ducts**
Test equipment system to study the dynamics and the controlability of air conditioning processes, 12:37082 (R;FI;In Finnish)
**Field Tests**
Prerequisities for functioning of the natural ventilation, 12:37093 (R;FI;In Finnish)
**Mathematical Models**
Prerequisities for functioning of the natural ventilation, 12:37093 (R;FI;In Finnish)
**Particles**
Indoor particle concentration and the outdoor to indoor transport. Part 3. Effects of airconditioning systems, 12:37088 (R;FI;In Finnish)

**VENTS**
**Draft Control Systems**
Measured energy savings from vent dampers in low rise apartment buildings, 12:37041 (RA;US)
**Safety Engineering**
Flame acceleration in mixtures of hydrogen and air, 12:36579 (R;US)

**VENUS REACTOR**
**Mixed Oxide Fuels**
Diffusion theory calculations for the pin-wise power distribution in VENUS-I and VENUS-II, 12:36777 (R;US)
**Reactor Lattices**
Diffusion theory calculations for the pin-wise power distribution in VENUS-I and VENUS-II, 12:36777 (R;US)

**VERIFICATION**
**Research Programs**
Arms control activities in LLNL, 12:37195 (J;US)
**Technology Assessment**
Arms control and treaty verification technology: Contributions from the nonweapons laboratories, 12:37194 (R;US)

**VERTEBRAE**
**Biomedical Radiography**
Mechanical and morphological evaluation of age-related changes in the Beagle spine, 12:37876 (RA;US)
**Morphology**
Mechanical and morphological evaluation of age-related changes in the Beagle spine, 12:37876 (RA;US)

**VERTICAL AXIS TURBINES**
**Computerized Simulation**
VAWT stochastic wind simulator, 12:36742 (R;US)
**Design**
Sandia National Laboratories 34-meter diameter vertical axis wind turbine test bed, 12:36747 (BA;US)
Structural design and fabrication of the Sandia 34-meter vertical axis wind turbine, 12:36746 (BA;US)
**Fabrication**
Structural design and fabrication of the Sandia 34-meter vertical axis wind turbine, 12:36746 (BA;US)
**Test Facilities**
Sandia National Laboratories 34-meter diameter vertical axis wind turbine test bed, 12:36747 (BA;US)

**VESSELS**

**VINYL MONOMERS**
**Electrochemistry**
Fluorescence emission as a probe to investigate electrochemical polymerization of 9-vinylanthracene, 12:37433 (J;US)
**Polymerization**
Fluorescence emission as a probe to investigate electrochemical polymerization of 9-vinylanthracene, 12:37433 (J;US)

**VISCOSIMETERS**
Vacuum still bottoms viscometer, 12:36289 (B;US)

**VISCOUS FLOW**
**Mathematical Models**
Modeling the viscous wall region, 12:38107 (J;US)

**VISIBLE RADIATION**
**Pulses**
The group velocity of short optical pulses, 12:38318 (BA;US)
**Wave Propagation**
Light and group theory, 12:38228 (BA;US)
The group velocity of short optical pulses, 12:38318 (BA;US)

**VISITOR CENTERS**
*See PUBLIC BUILDINGS*

**VITAMIN A**
**Structure-Activity Relationships**
Time-resolved laser studies on the proton pump mechanism of bacteriorhodopsin: Progress report, December 1, 1984-November 30, 1987, 12:36640 (R;US)

**VITRIFICATION**
**Quality Assurance**
Statistical process control: An approach to quality assurance in the production of vitrified nuclear waste, 12:36528 (R;US)

**VOIDS**
**Detection**
Effect of nonspherical pores and multiple scattering on the ultrasonic characterization of porosity, 12:37262 (BA;US)
Ultrasonic attenuation measurement by backscattering analysis, 12:37365 (BA;US)
**Sizing**
Effect of nonspherical pores and multiple scattering on the ultrasonic characterization of porosity, 12:37262 (BA;US)
Surface roughness effects in porosity assessment by ultrasonic attenuation spectroscopy, 12:37263 (BA;US)
**Wave Propagation**
Effect of nonspherical pores and multiple scattering on the ultrasonic characterization of porosity, 12:37262 (BA;US)
Ultrasonic attenuation measurement by backscattering analysis, 12:37365 (BA;US)
**VOLATILE MATTER**
**Air Pollution Control**
VOC (volatile organic compounds) emissions from volatile organic liquid storage tanks-background information for promulgated standards. Final environmental impact statement, 12:37679 (R;US)
**Air Pollution Monitoring**
Precolumn sample-enrichment device for analysis of ambient volatile organics by gas chromatography-mass spectrometry, 12:37636 (R;US)
**Control**
Chemistry of oxidant formation: implications for designing effective control strategies, 12:37655 (R;US)
**Indoor Air Pollution**
Control-technology assessment for coal gasification and liquefaction processes, 12:36275 (R;US)
Health-hazard evaluation report HETA-82-059-1752, Art Academy of Cincinnati, Cincinnati, Ohio, 12:37693 (R;US)
**VOLCANOES**
**Ashes**
Mount St. Helens: the aftermath, 12:37673 (R;US)

## W

**W MINUS BOSONS**
*Prior to October 1985 this concept was indexed to INTERMEDIATE VECTOR BOSONS.*
**Leptonic Decay**
Latest results from the UA2 experiment, 12:38132 (RA;US)
**Particle Production**
Latest results from the UA2 experiment, 12:38132 (RA;US)
**Particle Properties**
Electroweak interactions - standard and beyond, 12:38190 (RA;US)
**Weak Hadronic Decay**
Latest results from the UA2 experiment, 12:38132 (RA;US)
**W PLUS BOSONS**
*Prior to October 1985 this concept was indexed to INTERMEDIATE VECTOR BOSONS.*
**Leptonic Decay**
Latest results from the UA2 experiment, 12:38132 (RA;US)
**Particle Production**
Latest results from the UA2 experiment, 12:38132 (RA;US)
**Particle Properties**
Electroweak interactions - standard and beyond, 12:38190 (RA;US)
**Weak Hadronic Decay**
Latest results from the UA2 experiment, 12:38132 (RA;US)
**WALLS**
**Thermal Conduction**
Conduction of heat from a planar wall with uniform surface temperature to a monodispersed suspension of spheres, 12:37503 (J;US)
**Thermal Insulation**
Retrofit wall insulation study, 12:37039 (RA;US)
**Thickness**
Reduced girth seam weldments for heavy-walled vessels, 12:36249 (RA;US)
**WANKEL ENGINES**
**Reviews**
Automobile engines. Design and function, 12:37163 (R;DE;In German)
**WARFARE**
*See also CHEMICAL WARFARE*
**Computerized Simulation**
A study of Economy of Force: An analysis of varying the size of a main and secondary taskforce against a dynamic defense, 12:38400 (R;US)
**Functional Models**
Transition to deterrence based on strategic defense, 12:37191 (J;US)
**Nuclear Deterrence**
Avoiding war with the Soviet Union, 12:37192 (J;US)
**Nuclear Weapons**
Command and control of the US heavy division on the nuclear battlefield, 12:37588 (R;US)
Tactical encirclement reductions, 12:37589 (R;US)
**WASTE BURIAL**
*See UNDERGROUND DISPOSAL*
**WASTE DISPOSAL**
*See also GROUND DISPOSAL*
*MARINE DISPOSAL*
*RADIOACTIVE WASTE DISPOSAL*
*SANITARY LANDFILLS*
*UNDERGROUND DISPOSAL*
**Environmental Impacts**
Environmental problems involved in the disposal of fly ash from waste incineration on waste dumps. Summaries, 12:37807 (R;DE;In German)
**Ground Disposal**
Superfund federal-lead remedial project-management handbook. Final report, 12:37812 (R;US)
Superfund state-lead remedial project-management handbook. Final report, 12:37813 (R;US)
**Land Pollution**
Testing to determine relationship between explosive-contaminated sludge components and reactivity. Final report, June 1985-January 1987, 12:37837 (R;US)
**Research Programs**
EPA (Environmental Protection Agency) research program guide, FY 1987, October 1, 1986-September 30, 1987, 12:36965 (R;US)
**Sanitary Landfills**
Minimum-technology guidance on single-liner systems for landfills, surface impoundments, and waste piles - design, construction, and operation. Draft report 1982-85, 12:37809 (R;US)
Treatment of landfill leachate at publicly owned treatment works, 12:37815 (R;US)
**Site Selection**
Superfund innovative technology evaluation (site) strategy and program plan, 12:37811 (R;US)

**Water Pollution Monitors**
Health and Safety Program for ground-water investigations at 39 waste management sites within the Oak Ridge Gaseous Diffusion Plant, Oak Ridge, Tennessee, 12:36518 (R;US)

**WASTE ISOLATION PILOT PLANT**
*See WIPP*

**WASTE MANAGEMENT**
*See also RADIOACTIVE WASTE MANAGEMENT*
*WASTE DISPOSAL*
*WASTE PROCESSING*
*WASTE TRANSPORTATION*
**Surveys**
Hazardous-waste staff-assistance survey, Patrick AFB and Cape Canaveral AFS, Florida. Final report, 4 July-9 December 1986, 12:36957 (R;US)
**Technology Assessment**
DOE Hazardous Waste Remedial Actions Program: Annual report, FY 1986, 12:36959 (R;US)
**Technology Utilization**
Annual report to the Congress, Fiscal Year 1986 (Office of Technology Assessment), 12:36973 (R;US)

**WASTE PROCESSING**
*See also ANAEROBIC DIGESTION*
*MATERIALS RECOVERY*
*RADIOACTIVE WASTE PROCESSING*
**Technology Utilization**
Superfund treatment technologies: a vendor inventory, 12:37814 (R;US)

**WASTE PROCESSING PLANTS**
**Pyrolysis**
Construction and testing of a pyrolysis plant for disposal of special wastes with recovery of raw materials and energy. Final report, 12:37521 (R;DE;In German)
**Waste Heat Utilization**
Construction and testing of a pyrolysis plant for disposal of special wastes with recovery of raw materials and energy. Final report, 12:37521 (R;DE;In German)

**WASTE PRODUCT UTILIZATION**
Recovery and reuse of asphalt roofing waste: recycling roofing waste to new roofing, 12:37139 (R;US)

**WASTE TRANSPORTATION**
**Planning**
Developing a national system for transporting high-level nuclear waste, 12:36495 (BA;US)
**Transportation Systems**
Developing a national system for transporting high-level nuclear waste, 12:36495 (BA;US)

**WASTE TREATMENT**
*See WASTE PROCESSING*

**WASTE WATER**
**Fermentation**
Utilization of solid matter and the saving of energy within the sphere of the sugar industry by means of the biotechnical use of extracted cossettes - Phase 2. Final report, 12:36596 (R;DE;In German)
**Health Hazards**
Health-hazard evaluation report HETA 85-441-1765, New Boston Coke Corporation, New Boston, Ohio, 12:36291 (R;US)
**Purification**
Characterization, renovation, and utilization of water from slurry-transport systems, 12:36348 (R;US)
**Qualitative Chemical Analysis**
Separation and detection of ammonia, amines, and alkanolamines with single-column ion chromatography, 12:36474 (R;US)
**Quantitative Chemical Analysis**
Organic solute profile of water from Rio Blanco Retort 1, 12:36473 (R;US)
**Radioactivity**
Radioactivity in coal, ashes and selected wastewaters from Canadian coal-fired steam electric generating stations, 12:37849 (R;CA)
**Water Treatment**
Anaerobic fluid-bed treatment of coal conversion wastewater: Third quarterly technical progress report for the period February 16-May 15, 1987, 12:36327 (R;US)
Estimates of wastewater-treatment capital requirements in rural America. Staff report, 12:36970 (R;US)
Testing to determine relationship between explosive-contaminated sludge components and reactivity. Final report, June 1985-January 1987, 12:37837 (R;US)
**Water Treatment Plants**
Treatment of landfill leachate at publicly owned treatment works, 12:37815 (R;US)

**WASTE-FUELED BOILERS**

**Gasification**
Trace metal removal from combustion gases, 12:36335 (R;FI;In Finnish)

**WATER**
*See also GROUND WATER*
*WASTE WATER*
**Biological Availability**
Regeneration of baldcypress (Taxodium distichum (L.) Rich.) as related to drought in the LaBranche wetlands of Southern Louisiana, 12:38021 (RA;US)
White alder growth and development: the effect of small hydroelectric projects in the Sierra Nevada of California (Alnus rhombifolia), 12:36616 (RA;US)
**Biological Effects**
Interaction of $H_2O$ and nitrogen stresses on trees: Progress report, 1 October 1986 to 30 September 1987, 12:36627 (R;US)
**Consumption Rates**
Water jet/jet assisted cutting and drilling, 12:36340 (R;GB)
**Desalination**
Simultaneous production of desalinated water and power using a hybrid-cycle OTEC plant, 12:36678 (J;US)
**Electrolysis**
Pilot scale (100 kW) water electrolysis plant based on inorganic-membrane-electrolyte technology. Final report, 12:36575 (R;DE)
**Equations of State**
Temperature-dependent parameters and the Peng-Robinson equation of state, 12:37413 (J;US)
**Excitation**
Nonlinear-spectroscopic studies of highly excited states of molecules in supersonic beams, 12:38096 (R;US)
**Photolysis**
Photochemical dissociation of water: Development and study of new heterogeneous catalysts. Final report, 12:36576 (R;DE)
**Quantitative Chemical Analysis**
Application of XAD-4 solid sorbent and HPLC [high performance liquid chromatography] with electrochemical detection to the analysis of phenols in water: Final report, November 1983-November 1985, 12:37377 (R;US)
**Solubility**
Mutual solubilities in six binary mixtures of water + a heavy hydrocarbon or a derivative, 12:37418 (J;US)
**Vapor Pressure**
Temperature-dependent parameters and the Peng-Robinson equation of state, 12:37413 (J;US)

Status of geologic investigations for nuclear waste disposal at the Nevada Test Site, 12:36509 (RA;US)

## Z

**Z NEUTRAL BOSONS**
*Prior to October 1985 this concept was indexed to INTERMEDIATE VECTOR BOSONS.*
**Leptonic Decay**
Latest results from the UA2 experiment, 12:38132 (RA;US)
Search for new interactions via lepton flavor violation at or beyond the $Z^0$ pole., 12:38174 (RA;US)
**Mass**
Physics from $Z^0$ measurements: mass, width, and total cross section, 12:38166 (RA;US)
Report on electroweak parameters, 12:38171 (RA;US)
Status report on the polarization facility at the SLC, 12:38173 (RA;US)
Study of QED radiative corrections at the Z, 12:38168 (RA;US)
**Particle Production**
Latest results from the UA2 experiment, 12:38132 (RA;US)
Physics from $Z^0$ measurements: mass, width, and total cross section, 12:38166 (RA;US)
Renormalization group improved Yennie-Frautschi-Suura Theory and Monte Carlo event generators, 12:38169 (RA;US)
Report on electroweak parameters, 12:38171 (RA;US)
Search for new interactions via lepton flavor violation at or beyond the $Z^0$ pole., 12:38174 (RA;US)
Status report on the polarization facility at the SLC, 12:38173 (RA;US)
Study of QED radiative corrections at the Z, 12:38168 (RA;US)
Toponium-$Z^0$ mixing, 12:38192 (RA;US)
**Particle Properties**
Electroweak interactions - standard and beyond, 12:38190 (RA;US)
**Particle Widths**
Physics from $Z^0$ measurements: mass, width, and total cross section, 12:38166 (RA;US)
Study of QED radiative corrections at the Z, 12:38168 (RA;US)
**Standard Model**
$E^+e^- \rightarrow W^+W^-$ in $E_6$ models with additional neutral gauge bosons, 12:38199 (J;US)
**Weak Hadronic Decay**
Latest results from the UA2 experiment, 12:38132 (RA;US)
Search for flavor-changing neutral currents at the $Z^0$, 12:38165 (RA;US)
**Z PINCH DEVICES (LINEAR)**
*See LINEAR Z PINCH DEVICES*
**ZEOLITES**
**Catalytic Effects**
Catalytic and physicochemical properties of zeolites with geometrical selectivity, 12:36409 (R;FR;In French)
**Sorptive Properties**
Evaluation of silver mordenite for radioiodine retention at the PUREX Process Facility Modification, 12:36489 (R;US)
**ZINC**
**Corrosion**
Effects of sheltering and orientation on the atmospheric corrosion of structural metals, 12:37634 (R;US)
**Emission**
Zinc/zinc oxide preliminary source assessment, 12:37690 (R;US)
**Uptake**
Uptake and distribution of heavy metals in annelidae, with particular regard to limnic tubificides (oligochaeta), 12:37987 (R;DE;In German)
**Water Pollution**
Effects of contaminants on naiad mollusks (Unionidae): a review, 12:38000 (R;US)
**ZINC OXIDES**
**Catalytic Effects**
Solid state, surface and catalytic properties of oxides: Final report, 12:37392 (R;US)
**Emission**
Zinc/zinc oxide preliminary source assessment, 12:37690 (R;US)
**Surface Properties**
Solid state, surface and catalytic properties of oxides: Final report, 12:37392 (R;US)
**ZINC PHOSPHIDES**
**Crystal Structure**
Metal site disorder in zinc tin phosphide, 12:37356 (J;US)
**Electronic Structure**
Metal site disorder in zinc tin phosphide, 12:37356 (J;US)
**Photoconductivity**
Metal site disorder in zinc tin phosphide, 12:37356 (J;US)
**ZINC-BROMINE BATTERIES**
Zinc-bromine battery development, 12:36946 (R;US)

**ZION STATION UNIT-1**

*Zion, Illinois, USA*
**Containment Systems**
DCH-1: first direct containment heating experiment in the SURTSEY test facility, 12:36910 (RA;US)
**Reactor Safety**
DCH-1: first direct containment heating experiment in the SURTSEY test facility, 12:36910 (RA;US)
**ZIRCALOY 2**
**Fuel Cans**
Automated system for assessing the cladding thickness and bond integrity of tubular nuclear fuel elements, 12:36810 (R;US)
**ZIRCONIUM**
**Deposition**
Laser cladding of Mg and Nb alloys for improved environmental resistance. Annual report, January 1986-January 1987, 12:37201 (R;US)
**ZIRCONIUM COMPOUNDS**
*See also ZIRCONIUM OXIDES*
**Crystal Structure**
YPt/sub 2/In and other compounds of the ZrPt/sub 2/Al-type, 12:37360 (J;US)
**Hydrolysis**
Nucleation and growth of uniform m-ZRO/sub 2/, 12:37315 (BA;US)
**Ionic Conductivity**
Copper ion-conducting materials in chloride melts, 12:36943 (R;DK;In Danish)
**ZIRCONIUM ISOTOPES**
**Excited States**
Observation of full sets of coexisting intruder excitations in the N=58 isotones and isotopes of Zr: Evidence for alpha correlated excitations, 12:38256 (BA;DE)
**ZIRCONIUM OXIDES**
Thermal-shock resistance of mullite-based SiC-whisker composites. Master's thesis, 12:37326 (R;US)
**Chemical Preparation**
Nucleation and growth of uniform m-ZRO/sub 2/, 12:37315 (BA;US)
Preparation of Al/sub 2/O/sub 3/-ZrO/sub 2/ composites by adjustment of surface chemical behavior, 12:37308 (BA;US)
**Corrosion Resistance**
Ceramic thermal barrier coatings with improved corrosion resistance, 12:37303 (R;US)
**Crystal Growth**
Nucleation and growth of uniform m-ZRO/sub 2/, 12:37315 (BA;US)
**Mechanical Properties**
Transformation toughening of ceramics. Annual report No. 1, 1 September 1985-31 August 1986, 12:37278 (R;US)
**Nucleation**
Nucleation and growth of uniform m-ZRO/sub 2/, 12:37315 (BA;US)
**Perturbed Angular Correlation**
Zirconia characterization by perturbed angular correlation spectroscopy, 12:37320 (BA;US)
**Phase Transformations**
Transformation toughening of ceramics. Annual report No. 1, 1 September 1985-31 August 1986, 12:37278 (R;US)
**Spectroscopy**
Zirconia characterization by perturbed angular correlation spectroscopy, 12:37320 (BA;US)
**Structural Chemical Analysis**
Zirconia characterization by perturbed angular correlation spectroscopy, 12:37320 (BA;US)
**ZT-40 DEVICES**
**Operation**
Pellet injection on the ZT-40M reversed field pinch, 12:38386 (J;US)
**Pellet Injection**
Pellet injection on the ZT-40M reversed field pinch, 12:38386 (J;US)
**ZYMOMONAS MOBILIS**
**DNA Sequencing**
Promoter and nucleotide sequences of the Zymomonas mobilis pyruvate decarboxylase, 12:37867 (J;US)

# CONTRACT NUMBER INDEX

Numbers assigned to DOE contracts under which documents announced in this publication were prepared are included in this index.

| *Contract No.* | *Abstract No.* | *Report No.* |

# REPORT NUMBER INDEX

The numbers assigned to reports cited in this publication appear in the first column of the index. Cross reference information and/or availability are included as appropriate. Abbreviations used in the availability column are elaborated at the end of the index. To expedite the filling of orders for reports from NTIS and OSTI, a file number in the form DE82000001 or TI82000001 appears in column 3. File numbers with DE prefixes may be used in ordering from both NTIS and OSTI. Numbers with TI prefixes are valid at OSTI only. Requesters are urged to use this file number where provided. In column 4, one or more DOE distribution categories are indicated, e.g., STD-10, MN-25. STD indicates distribution was made in full-size copy; MN indicates microcopy distribution; ND indicates no distribution was made. These category numbers are included to assist DOE librarians in responding to requests for reports in their collections. The UC (Unclassified Distribution Categories) are defined in DOE/TIC-4500, available from OSTI. The citation numbers are given in column 5. NOTE: DOE attempts to disseminate its information as broadly as possible. Even though a report may contain some degree of illegibility, it is believed that the report may still make a contribution. The presence of a 1, 2, or 3 following NTIS in the availability column denotes the document quality for microfiche (MF) and printed copy (PC) production: 1 = 92 to 95% legibility, available PC and MF; 2 = 88 to 91% legibility, available MF only; 3 = 87% or less legibility, available PC only. Employees of DOE or DOE contractors are urged to order from the Office of Scientific and Technical Information (OSTI); all others should order from the National Technical Information Service (NTIS).

# FILE NUMBER CORRELATION

This correlation list is provided for those organizations where document storage is alphanumeric by report number and request may be received by file number. For other information about a document (abstract number, distribution category, availability, and price), please refer to the Report Number Index.

# AVAILABILITY OF REFERENCES ABSTRACTED

## REPORTS

A document cited in this publication is considered a "report" when it carries a unique identifying number (e.g., ANL-3130, BNL-4000, DP-150, etc.) as the first element of the citation. Usually, one or more of the following abbreviations will appear at or near the end of the citation, indicating the organization from which the document is available. If none of these abbreviations appears, the report should be requested from either the cited publisher or corporate source.

GPO — Available from the Superintendent of Documents, U. S. Government Printing Office, Washington, DC 20402.

GPO Dep. — Available for inspection or interlibrary loan at GPO depository libraries. Unlimited DOE reports are being sent to the GPO depository libraries. See inside back cover for list of the libraries. These reports are identified by report number, Supt. of Docs. Class Number (E 1.99:) and OSTI accession/file number, e.g., DE87003384.

NTIS — For sale by the National Technical Information Service (NTIS), 5285 Port Royal Road, Springfield, VA 22161. Paper copy (PC) and other price codes are for domestic users; prices for foreign purchasers are, in most instances, twice the domestic price. There is only one microfiche (MF) price code, MF A01 ($6.50).

OSTI — Available from the Office of Scientific and Technical Information (OSTI), U. S. Department of Energy, P. O. Box 62, Oak Ridge, TN 37831, Attn: Technical Information Division.

**NOTE:** DOE offices and contractors should order reports from OSTI; all others should order from NTIS. For additional information, see the introductory paragraph to the Report Number Index.

## NTIS NORTH AMERICAN PRICE CODES

Most NTIS products and services are now announced by price codes and, therefore, without specific prices in NTIS journals, newsletters, and indexes.

The current dollar equivalent for each code is shown in the schedule below. Orders must list the accession number(s) and be accompanied by the total dollar amount from the current schedule.

**NORTH AMERICAN CONTINENT PRICE SCHEDULE**

**Customers in Canada, United States, and Mexico, please use this price schedule; other addressees, write for PR-360-4.**

| MICROFICHE | EXCEPTIONAL | MAGNETIC TAPES | DISKETTES |

## NON-REPORT DOCUMENTS

**BOOKS**

Most books cited are available from commercial publishers. Order from the publisher or other source as given, not from OSTI.

**CONFERENCE PAPERS**

Individual conference papers (or preprints) not available as reports should be requested from the originator or other source as cited.

**CONFERENCE PROCEEDINGS**

Many proceedings are available from commercial publishers; in other cases, request from the society, organization, institution, etc., cited as the source.

**DISSERTATIONS (THESES)**

Available from University Microfilms International, Dissertation Copies, P. O. Box 1764, Ann Arbor, MI 48106. Request by order number cited, e.g., 87-22,350.

**JOURNAL ARTICLES**

Users must use their own resources to obtain (or scan) articles cited—local, state, or university libraries or publishers, reprint services, etc.

**MONOGRAPHS**

Request from the organization, institution, society, etc., responsible for the monograph.

**PATENTS**

Although not cataloged as reports, patents cited from each country are listed in the Report Number Index under PATENTS-AU, PATENTS-FR, PATENTS-US, etc. U. S. Patent Applications (e.g., A 293,415) are available from NTIS.

# CODES USED ON INDEX LINES

Following the citation numbers in the Corporate Author, Personal Author, and Subject Indexes, codes are used to designate the type of document, country of publication, and language of the document, e.g., (R;SU;RU). The language designator does not appear if the document is published in English.

# FEDERAL DEPOSITORY LIBRARY PROGRAM

As a result of an agreement between the U. S. Government Printing Office (GPO) and the Department of Energy, beginning in 1984 DOE reports with unlimited distribution are now included in the Federal Depository Library Program. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and interlibrary loans; however, they are *not* sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself. Do not send checks or orders to these libraries.
